ABSTRACT

39

The study proposes to develop a two-stage automated coffee bean sorter that identifies the good beans, less-dense beans and at the same time segregating the defective coffee bean using machine vision and density-based analysis. In the first stage, the defective beans will be detected through the use of machine vision, parameters such as size and defects are taken into account. The second stage is used to categorize each bean by its density, which is calculated by its mass and volume. Thus, beans with relatively low density and not within the size threshold, are sorted out. The system aims to incorporate machine vision and density analysis to reduce human labor and provide an alternative to manual sorting methods for the farmers and coffee bean producers.

48

Index Terms—computer vision, deep learning, density-based analysis, Arabica, green coffee beans, sorting.

Chapter 1

301

INTRODUCTION

302 **1.1 Background of the Study**

303 Coffee is one of the most globally consumed beverages. It is a vital product in the global
304 market, with production reaching 168.2 million bags in 2022-2023. The coffee industry
305 is expected to grow even more in the coming years, with output projected to rise by 5.8%
306 in 2023-2024 [International Coffee Association, 2023]. In the Philippines, coffee holds a
307 strong cultural significance, with the local industry continuously expanding. The country is
308 the 14th largest coffee producer in the world. Locally, the industry is expected to grow at a
309 compound annual growth rate (CAGR) of 3.5% from 2021 to 2025, driven by small-scale
310 farm households [Santos and Baltazar, 2022]. With a growing popularity among coffee
311 enthusiasts, the demand for specialty coffee is increasing as well. Consumers are becoming
312 more selective about the quality of their coffee beans [Tampon, 2023].

313 To stay competitive in the rapidly evolving coffee industry, farmers carefully select
314 high-quality coffee beans for production. Grading green coffee beans is a crucial part of
315 coffee production, as it is directly associated with the quality of the cup quality of coffee
316 brews [Barbosa et al., 2019]. Coffee grading is a process in the industry that determines the
317 quality of coffee beans, using various parameters such as size, density, color, and defects,
318 ensuring that only high quality beans are selected for consumption [Córdoba et al., 2021].
319 The size of coffee beans is determined using a screen size and sorting procedure, where
320 the coffee beans are categorized into different screen sizes, with larger beans considered
321 higher quality [González et al., 2019]. The density of a bean can be calculated by the ratio
322 of its mass and volume, which greatly influences the roasting process and overall quality of
323 the coffee [Datov and Lin, 2019]. Color is also another indicator for quality, with darker
324 beans being preferred for their richer flavor profile. On the other hand, defects are classified

325 among 3 categories: Category 1 includes the most severe issues such as foreign matter
326 and black beans, Category 2 includes less severe defects like broken beans, and Category
327 3 includes minor defects like slight discoloration. Determining the quality of the coffee
328 beans in relation to their defect values is based on quality standards and grading systems
329 such as SCAA protocols guidance or the Philippine National Standard on Green Coffee
330 Bean [Bureau of Agriculture and Fisheries Standards, 2012].

331 Traditionally, this stage of assessing and categorizing coffee beans relies on visual
332 evaluation, which is time-consuming and labor-intensive, making it prone to human error.
333 One of the biggest challenges in coffee bean production is ensuring consistency in quality.
334 As the demand for specialty coffee continues to grow, there has also been an increase
335 for the need of more efficient and accurate sorting methods. The application of modern
336 technology can help reduce the labor costs and minimize human errors in these tasks.
337 In recent years, computer vision was used alongside various machine learning models
338 and techniques, such as convolutional neural networks (CNNs), support vector machines
339 (SVMs), or K-nearest neighbors (KNN) models, where the models were trained on labeled
340 data to classify images of coffee beans into different quality categories. The proposed aims
341 to utilize this technology to develop a two-stage automated coffee bean sorting system
342 using machine vision and density-based analysis to categorize and identify and segregate
343 specialty-grade green coffee beans from non-specialty and defective coffee beans.

344 1.2 Prior Studies

345 Identifying and sorting specialty-grade coffee beans can be strenuous since the traditional
346 way of classifying a specialty-grade coffee is by manually sorting the coffee bean batch and

347 classifying them according to the set of standards of the SCAA. The existing work aims
 348 to solve these problems through image processing and implementing deep learning-based
 349 models to automatically sort the coffee beans while achieving high accuracy. However,
 350 these solutions only automate detecting either one of the parameters such as defects, color,
 351 and size, while the proposed system considers density, size, color and defects all in one
 352 system. Hence, eliminating human intervention or labor. The table below shows the
 353 comparison of existing solutions to the researcher's proposal aligning with the traditional
 354 way of sorting coffee beans.

TABLE 1.1 SUMMARY OF THE LITERATURE REVIEW

Existing Literature	Description
Defect Detection	<p>The existing literature focuses on using various machine learning models such as YOLO, KNN, and CNN to detect defects in green coffee beans, through identifying visible defects like black spots, broken beans, discoloration, and more. These existing approaches heavily rely on visual characteristics and do not consider other key factors that affect green coffee bean quality like density, which can enhance classification accuracy. The proposed system integrates density and size analysis alongside the defecting various levels of defects on the coffee bean for a more holistic detection and classification.</p>

**Coffee Bean Grading and Quality Assessment**

The existing literature utilize algorithms such as artificial neural networks, support vector machine, and random forest to grade and classify coffee beans according to the specified grading system. These methods primarily focus on visual features of the beans, which do not account the bean's density and size, which are both essential factors for classifying specialty-grade coffee beans. Additionally, there is a lack of practical implementation of automated sorting systems, as these focus on simply classifying the beans. Through a two-stage process, the proposed system will take into consideration both the visual inspection and the density measurement, which leads to a more complete classification of coffee beans.

Automated Sorting and Classification System	<p>Research has been conducted on developing that automate the process of sorting coffee beans according to various parameters. Some studies focus on sorting defectives against non-defective, while others focus on other visual parameters like defects and roast profiles. These systems focus only on visual characteristics, without considering the actual size of the bean and its density as parameters for better classification accuracy. The proposed system will integrate the use of visual, density, and size parameters to enable a comprehensive automated sorting solution for classifying specialty-grade coffee beans.</p>

356

1.3 Problem Statement

357

The Philippine coffee industry is a growing market, however it is stuck with using traditional methods in sorting green coffee beans. Often relying on manually sorting the beans, it exposes a number of problems that are apparent in the industry. Relying on manual sorting increases production cost which results in higher prices for quality coffee beans. To make the Philippine coffee beans more competitive to the exported beans, reducing the price is crucial. Another problem that is encountered in manual sorting heavily focuses only on the physical attributes of the bean like size and appearance. There are standards that need to be met, which forces the farmers to resort to manual sorting to comply with the standards

365 of the SCAA. The SCAA standards require a 300g batch of green coffee beans must not
366 contain any defects and the size consistency of the beans must not exceed 5% variance.
367 Another reason why coffee processors still opt to do manual sorting is because there are no
368 commercially available and reliable GCB sorting machines [Lualhati et al., 2022]. There is
369 a need for a coffee sorter that is able to efficiently and accurately sort GCB. Coffee bean
370 selection is carried out either manually, which is a costly and unreliable process [Santos
371 et al., 2020]. The manual sorting process limits scalability and quality control, putting the
372 strain on farmers as coffee shop owners' demands for high-quality coffee continue to rise
373 [Lualhati et al., 2022].

374 **1.4 Objectives and Deliverables**

375 **1.4.1 General Objective (GO)**

376 GO: To develop an automated (Arabica) green coffee bean sorter that identifies good,
377 less-dense and defective beans from an unsorted batch of coffee beans. The system will
378 utilize machine vision and density-based analysis for defect detection and classification of
379 the coffee beans, ensuring efficient coffee bean sorting.;

380 **1.4.2 Specific Objectives (SOs)**

- 381 • SO1: To gather and create a dataset consisting of 500 high-resolution images of
382 good Arabica green coffee beans and 200 high-resolution images per classification
383 of defective beans (Category 1 & Category 2).;
- 384 • SO2: To improve the synchronization between the machine vision system and the

385 embedded sorting mechanism, ensuring defect sorting of at least 20 beans per minute
386 for stage one, solving issues such as non-synchronization of the system.;

- 387 • SO3: To achieve an accuracy of at least 85% in classifying defective green coffee
388 beans using computer vision;
- 389 • SO4: To achieve an accuracy of at least 85% in filtering out less-dense green coffee
390 beans;

391 **1.4.3 Expected Deliverables**

392 Table 1.3 shows the outputs, products, results, achievements, gains, realizations, and/or
393 yields of the Thesis.

TABLE 1.3 EXPECTED DELIVERABLES PER OBJECTIVE

Objectives	Expected Deliverables
GO: To develop an automated (Arabica) green coffee bean sorter that identifies good, less-dense and defective beans from an unsorted batch of coffee beans. The system will utilize machine vision and density-based analysis for defect detection and classification of the coffee beans, ensuring efficient coffee bean sorting.	A Two-Stage Automated Coffee Bean Sorter System that identifies defective, good beans, and less-dense green coffee bean using machine vision and density-based analysis.
SO1: To gather and create a dataset consisting of 500 high-resolution images of good Arabica green coffee beans and 200 high-resolution images per classification of defective beans (Category 1 & Category 2).	<ul style="list-style-type: none"> • Data Gathering • Image Collection through High Quality Camera

394 **1.5 Significance of the Study**

395 The study explores the implementation of machine Vision and density analysis of an
396 automated coffee been sorter that can identify and sort out the defective, less-dense and
397 good green coffee beans. This said system would aid coffee sorters to mitigate manual
398 labor and to ensure that the sorting process of the GCB are accurate. In order to test the
399 effectiveness of the system, the study would gather data and compare the time efficiency
400 and accuracy of the manual sorting by a an expert sorter to be compared with the proposed
401 system. The system proposes significance to specific parts of society as follows:

402 **1.5.1 Technical Benefit**

403 This study would benefit the academe as this introduces a significant advancement in
404 coffee bean sorting technology by implementing both machine vision and density-based
405 analysis to detect and sort good coffee beans, less-dense and separating defective ones. The
406 proposed system would mitigate manual sorting that leads into insufficiency like human
407 error and fatigue. The system would improve the overall efficiency by operating at a faster
408 rate compared to manual labor. As a result, it would serve as a proof of concept for the
409 implementation of machine vision and density-based analysis in agricultural industries
410 specifically in the Philippine coffee industry.

411 **1.5.2 Impact to the Coffee Industry**

412 The study would aid coffee farmers and producers, by providing an automated system that
413 ensures accurate sorting of Arabica green coffee beans, the system aims to have an accurate
414 output to help maintain to yield higher quality coffee beans and allows coffee bussinesses

415 to scale up their operations, increase the competitiveness of exporting those beans, and
416 meet demand more efficiently. The productivity given from the system would potentially
417 strengthen the foundation of local coffee producers.

418 **1.6 Assumptions, Scope, and Delimitations**

419 **1.6.1 Assumptions**

- 420 1. There would be a defective coffee bean from the green coffee bean test batch;
- 421 2. Identifying the defective coffee beans using the machine vision and density-based
422 analysis would be much more efficient and accurate than manually sorting them;
- 423 3. During testing, test batches will contain 50% good beans and 50% defective beans,
424 60% good beans and 40% defective beans, 70% good beans and 30% defective beans,
425 80% good beans and 20% defective beans, 90% good beans and 10% defective beans,
426 100% good beans;

427 **1.6.2 Scope**

- 428 1. The study only focuses on Arabica green coffee beans;
- 429 2. The study has two stages, the first stage would segregate the defective green coffee
430 beans from the batch, then the second stage would identify the specialty-grade green
431 coffee beans depending on its density;

432 **1.6.3 Delimitations**

- 433 1. The batch of coffee beans to be used for testing and dataset collection will consist
434 solely of Arabica beans from the same origin, farmer, and processed in the same way;
- 435 2. The system is only limited to unroasted green coffee beans;
- 436 3. The batch of coffee beans to be used should only be dehulled and not sorted visually
437 and by density;
- 438 4. Since the system is considering several types of defects and density parameter, sorting
439 time is compromised;
- 440 5. The system is designed to perform individual scanning of each coffee bean;

LITERATURE REVIEW

443

2.1 Existing Work

TABLE 2.1 REVIEW OF RELATED LITERATURE

Literature	Description of the Literature
[Balay et al., 2024]	This study focused on the development of an automatic green coffee bean sorter. The algorithm used is the YOLOv8 to train the model, while a Raspberry Pi was used in order to test the model along with the sorting mechanism. There are a total of 6 defects that the system can detect these are full black, partial black, chipped, dried cherry, shell and dried cherries. A total of 10 trial were done to effectively test the system. Out of the 10 trials, 9 trials were found to have an average target sensitivity of 97.8%, with an average time of 2 minutes and 32 seconds for a total of 100 beans.
[Amadea et al., 2024]	In this study, a system was developed to detect defects in Arabica green coffee beans. The study used two different models such as Detection Transform (DETR) and You Only Look Once version 8 (YOLOv8). Upon comparison, YOLOv8 showed strengths in defect detection. On the other hand, DETR model showed significant strengths than the YOLOv8 model when it comes to defect detection.

[de Oliveira et al., 2016]	This study constructed a computer vision system that outputs measurements of green coffee beans, classifying them based on their color. In the system, Artificial Neural Network (ANN) was used as the transformation model. On the other hand, the Bayes classifier was used in classifying the coffee beans into four (whitish, cane green, green, and bluish-green). The model was able to achieve a small error of 1.15%, while the Bayes classifier achieved a 100% accuracy. To concluded, the developed system was able to effectively classify the coffee beans based on their color.
[Balbin et al., 2020]	In this study, the objective is to provide better technology for local coffee producers to increase export-quality beans production. Thus, the study proposed a device that can evaluate the size, quality, and roast level of a batch of beans fed into the machine. The model used in the system was the Black Propagation Neural Network (BPNN), together with other image processing techniques such as K-mean shift, Blob, and Canny Edge. These techniques were used to extract the features of the beans and analyzed using RGB analysis.

[Pragathi and Jacob, 2024]	The paper discusses the use of machine learning algorithms such as KNN and CNN to classify the specialty type coffee bean for Arabica. The coffee bean quality of an Arabica can be classified by the number of defective coffee bean presents in a sample. The defects are classified into two categories named primary and secondary.
[Lualhati et al., 2022]	With the lack of a locally made green coffee bean sorter in the Philippines, the researchers aimed to design and implement a device that will handle the sorting. The paper discusses the development of a Green Coffee Bean (GCB) quality sorter. The system used a PID based algorithm and image processing algorithm for sorting. It utilized two cameras to capture images of both sides of the GCB, this was done to check for the quality of the GCB through a prediction test. The paper conducted a total of 5 tests, each with varying conditions. The designed system on average got an accuracy score of 89.17% and sorting speed of 2 h and 45 mins per 1 Kg of GCB.

[García et al., 2019]

The paper discusses the use of computer vision for quality and defective inspection for GCBs. The paper makes use of parameters such as color, morphology, shape, and size to determine the quality of the GCB. It makes use of the algorithm k-nearest neighbors (KNN) to differentiate the quality and to identify the defective beans. The designed prototype makes use of an Arduino MEGA board to gather the data and a DSLR camera to capture the GCB. The type of bean used was an Arabica, and a total of 444 grains were used to test the prototype. The accuracy score for both the quality evaluation and defective beans resulted in an average of 94.79% and 95.78% respectively.

[Akbar et al., 2021]

The researchers proposed a system that sorts the Arabica coffee into 2 classes, defective and non-defective. After the classification into two classes, the coffee beans are then graded based on the quality consisting of: specialty grade, premium grade , exchange grade, below grade, and off grade. Utilizing computer vision for classifying the defective and non-defective beans, the researchers used the color histogram and the Local Binary Pattern (LBP) to get the color and the texture of the beans. The data gathered from both the color histogram and LBP are used to train two models, the random forest algorithm and the KNN algorithm. The results from both algorithms are both promising, with an average accuracy score of 86.56% using the random forest algorithm and 80.8% for the KNN algorithm, However, this result shows that utilizing the random forest algorithm provided better accuracy scores for the model.

[Huang et al., 2019]

The paper discusses the development of a GCB sorter in real-time by using Convolutional Neural Network (CNN). The researchers used a total of 72,000 images of good and bad beans, 36,000 per category respectively. A total of 7,000 images for the beans were picked at random to test the model, while the remaining was used to train the model. To test the model, a webcam was used to record the coffee beans, however this resulted in capturing only the topside of the bean, to solve this the beans were flipped to provide accurate results. This resulted in an average accuracy score of 93.34% with a false positive rate of 0.1007.

[Luis et al., 2022]

The paper focuses on using You Only Look Once (YOLOv5) as the algorithm for detecting the defective GCB. The researchers used a Raspberry Pi camera to capture the images of the coffee beans. To test the effectiveness of the developed system a total of 45 trials were conducted with varying classification that the model was trained on. The model tested a total of 15 trials for each classification, these classifications are black, normal and broken. Each classification provided different accuracy results, for the blackened coffee bean, a total of 106 coffee beans were tested which resulted with an 100% accuracy by correctly identifying 106 blackened coffee beans. For the normal coffee bean, a total of 117 beans were used which resulted in an accuracy score of 91.45% since only 107 out of 117, were accurately classified. Lastly, a total of 104 broken beans were used, which resulted with an accuracy score of 94.23% since only 98 beans were correctly classified. The average accuracy score of the system developed resulted in an average of 95.11%.

[Santos et al., 2020]	In this study, the development of quality assessment of coffee beans through computer vision and machine learning algorithms. The main parameters that this study considers are the shape and color features of the coffee bean and they used machine learning techniques such as Support Vector Machine (SVM), Deep Neural Network (DNN) and Random Forest (RF), to identify the coffee beans' defect. The script written in Python Language was used to extract shape and color features of the coffee beans based on the datasets. Overall, the system had a very high accuracy (>88%) on classifying coffee beans through the models that have been developed.
[Arboleda et al., 2020]	The study proposed a novel solution that deals with the low signal-to-noise ratio. The study shows a way of extracting features of an image in context with green coffee beans. The researchers concluded a new edge detection approach for green coffee beans. It was achieved by using the heuristic approach in calculating the right values for the discriminant and finding the best pixel formation.

[Susanibar et al., 2024]	The proposed system aims to implement a GCB automated classification based on size and defects. The paper classified each bean into three different sizes. The system used two stages to identify the sizes of each bean. Firstly the entrance of the system was measured to ensure that the bigger beans are not able to pass through. The second stage involves the use of a cylindrical sieve with holes. This resulted with an average accuracy score of 96% for classifying the beans in size. However, the system does not provide a good accuracy score in classifying beans in terms of its defect since it only averaged 80% when classifying the defects of the beans.
[Srisang et al., 2019]	The study proposed an oscillating sieve as the main way for sorting Robusta coffee beans. Sizes are differentiated into 4 classes: extra large (XL), large (L), medium (M), small (S). The sieve resulted in an accuracy score of around 79% in classifying the sizes of the coffee beans.

444

445

2.2 Lacking in the Approaches

Existing Studies	Proposed Study
------------------	----------------

- | | |
|---|---|
| <ul style="list-style-type: none">• Uses computer vision to classify green coffee bean grade based on its visual characteristics such as size, color, and shape.• Most related studies classify defective and non-defective beans only.• The density parameter of the green coffee beans is not considered.• Similar study [Lualhati et al., 2022] only considered three classifications of GCBs: Good, Black, and Irregular-Shaped beans.• Similar automated GCB sorter [Balay et al., 2024] only considered one side of the bean.• Existing classification of GCBs with automated sorters do not have an integrated graphical user interface (GUI) for data analytics. | <ul style="list-style-type: none">• Computer vision will be used to analyze the physical characteristics of the bean, including its volume.• Density parameters will be considered by implementing a weighing scale to the system.• The system will implement two stages of sorting:<ul style="list-style-type: none">– The first stage sorts out the defective beans.– The second stage sorts out the potential specialty-grade beans based on their density and size.• The system is designed to inspect both sides, utilizing two cameras.• The system is designed with a GUI for farmers to visualize the cumulative data of the defects present in the batch. |
|---|---|

446 2.3 Summary

447 The various related literature discusses the numerous technological advancements related to
448 coffee bean sorting to aid coffee farmers and producers on efficient sorting and classification
449 of beans. These studies provide insights regarding the various methods used in the field
450 of coffee sorting that utilize machine vision, density-based analysis, and deep learning to
451 identify and classify coffee beans based on their physical parameters. Numerous studies
452 discussed parameters like size, defects, and color. However, existing studies tend to
453 focus primarily on visual characteristics and lack integration density analysis for accurate
454 classification of green coffee beans. The review literature identifies and acknowledges the
455 gaps in current sorting practices, such as the lack of comprehensive systems that implement
456 machine vision and density-based analysis. The study aims to address these gaps by
457 proposing a two-stage sorting system that automates both detection of defective beans and
458 the classification of less-dense beans. Density and size will play a significant role, as it is
459 linked to identifying the quality of the coffee bean. However, related literature mentioned
460 overlooks this parameter for classifying the coffee bean. Higher density beans are often
461 associated with higher quality coffee beans, into being potential specialty-grade coffee after
462 roasting and cupping.

463

Chapter 3

464

THEORETICAL CONSIDERATIONS

465

3.1 Theoretical Framework

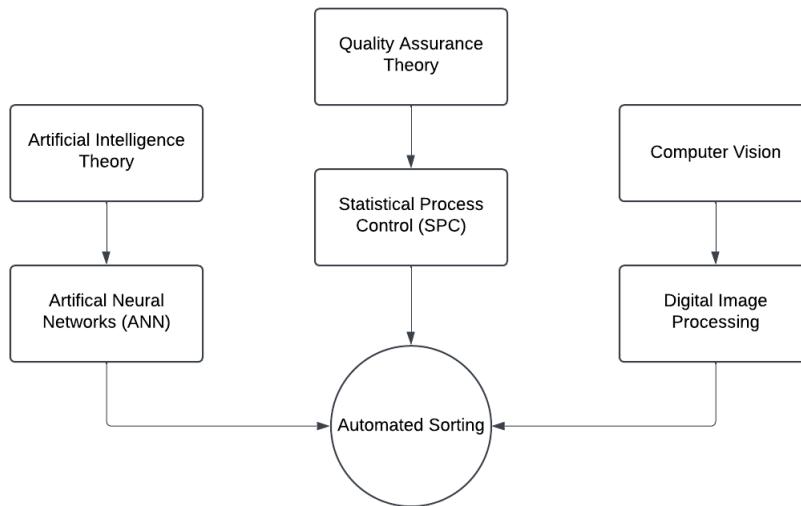

Fig. 3.1 Theoretical Framework

466

The theoretical framework discusses the multiple concepts that are involved in this study. These key concepts are crucial to ensuring the success of the thesis. There are three main concepts that are key to this study, the Artificial Intelligence Theory, the Quality Assurance Theory and lastly, Computer Vision.

470

3.2 Conceptual Framework

471

The conceptual framework shows the implementation of two systems which consists of machine vision and embedded systems. The framework describes the thought process of both systems with the end goal of integrating both systems. The machine vision handles the defect classification of the system, whereas the embedded system handles the sorting of

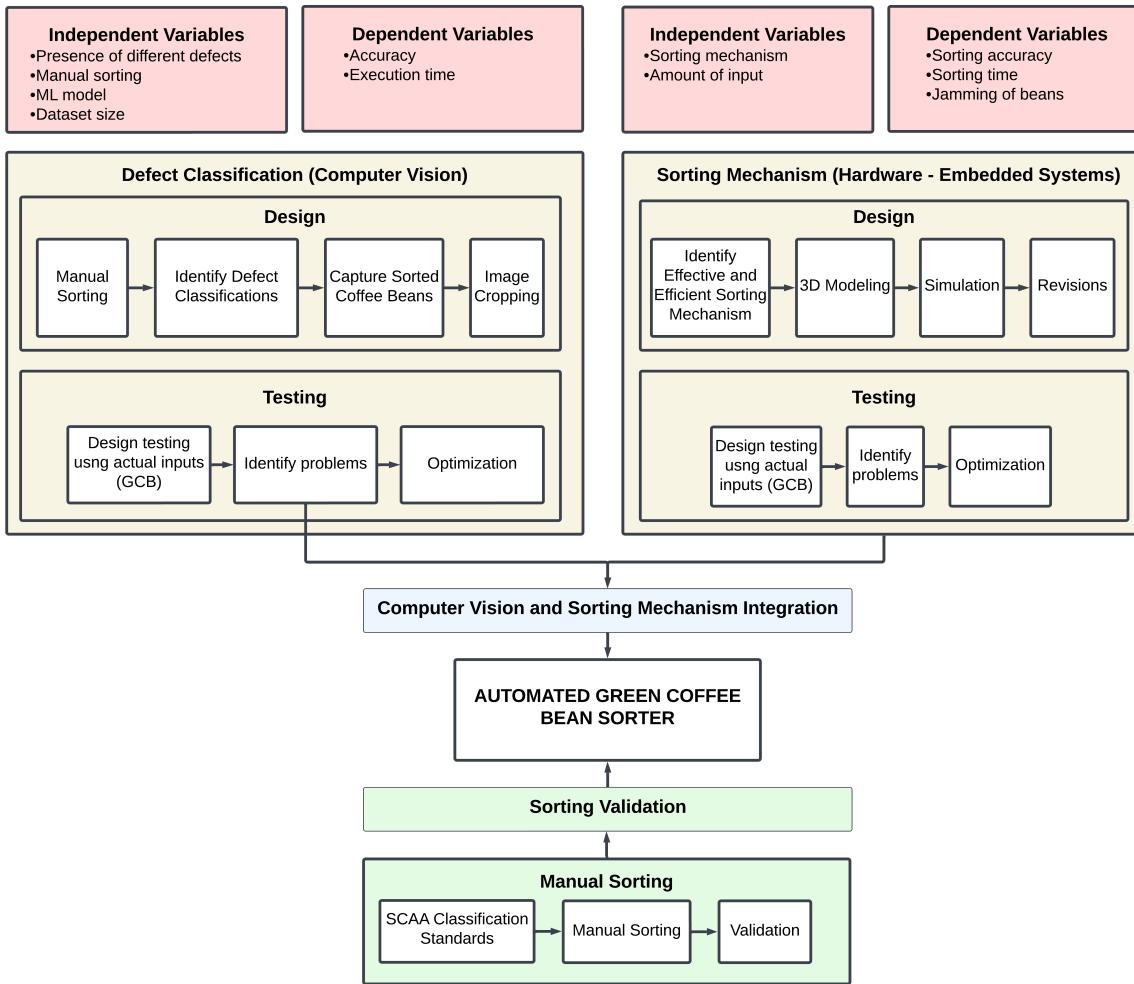

Fig. 3.2 Conceptual Framework

475 the beans. By integrating both systems together, creates an automated green coffee bean
 476 sorter. The data validation is done by sorting through the tested coffee beans by the system
 477 following the standards of the SCAA.

478 **3.3 Quality Assurance Theory**

479 Quality assurance theory refers to the set of principles and practices that focuses on estab-
480 lishing a systematic process to ensure that a product or service conforms to a predetermined
481 standard. In the aspect of food and agriculture, there are a number of practices and prin-
482 ciples that ensure the safety and quality of food products. According to [da Cruz et al.,
483 2006], there are a number of practices in place that must be followed, one of which is
484 Good Agricultural Practices, where these procedures are aimed to reduce hazards related to
485 product safety at the farm level. Another one of said practices is the Good manufacturing
486 practice, which were formerly called support programs that provide foundations to the
487 overall food safety management programme. This includes cleaning, maintenance, person-
488 nel training, calibration equipment, quality control, and pest control. Industries that adopt
489 such practices produce the following results, better quality products, greener initiatives
490 and better productivity within a department. Lastly, hazard analysis and critical control
491 points (HACCP), is a science-based system that was created to identify potential hazards
492 and actions to control said hazards. This practice is used to ensure food safety.

493 In the context of coffee beans, there are a number of systems in place to ensure that
494 quality beans are being provided to the consumer market. The governing body known as
495 the Specialty Coffee Association (SCAA) has implemented grades to green coffee beans
496 to provide a better way to classify said beans. These grades can be differentiated into 5
497 grades namely, Specialty Grade, Premium Coffee Grade, Exchange Coffee Grade, Below
498 Standard Coffee Grade, and Off grade Coffee. They are classified according to the number
499 of defects found in a sample batch of 300 grams and according to their size. Specialty
500 grade coffee beans are supposed to contain less than 5 defects in a sample batch while also

501 not allowing any primary defects to be present; it should only have less than 5% difference
502 between its sizes. Coffee beans in this grade should also contain a special attribute whether
503 in its body, flavor, aroma, or acidity, and its moisture content should only be in the range
504 of 9-13%. Premium Coffee grade beans should only contain 8 full defects in a sample
505 batch but primary defects are allowed in the sample batch. Similarly to specialty grade
506 coffee beans, its sizes should only contain a 5% difference to one another; it should also
507 contain a special attribute and moisture content should also be similar to its specialty grade
508 counterpart. Exchange coffee grade should contain defects ranging from 9-23 beans in a
509 sample batch, with sizes that can vary up to 50% difference in weight but also only 5% in
510 its sizes. Below standard and off grade coffee beans are classified according to the number
511 of defects present in a sample batch; 24-86 beans for below standard while more than 86
512 beans for off grade. These gradings are used to ensure that quality green coffee beans are
513 produced and ensure that consumers are provided with the best quality available.

514 **3.4 Artificial Intelligence Theory**

515 Artificial Intelligence in defect classification are widely used in this industry which are
516 commonly used in manufacturing and industrial applications. Several deep learning tech-
517 niques are used in order to achieve an effective defect classification. Models such as
518 convolutional neural networks (CNNs) and You Only Look Once (YOLO) are widely used
519 for classification. CNN utilizes an image based analysis and feature extraction approach
520 to identify different classifications. CNN is more effective in analyzing grid-like data like
521 images, making it suitable for defect classification [Das et al., 2019]. One of its major
522 advantages is its ability to automatically detect important features such as shape, patterns,

523 and edges. Although it may have its own advantages, there are also disadvantages that need
524 to be taken into account, mainly in scenarios that involve class imbalance and complex
525 backgrounds (Moon, 2021) . YOLO is another model that is suitable for defect classifica-
526 tion, its ability to provide real-time defect classification while also providing high accuracy
527 is essential in some industries. In YOLO, there are several versions that are developed over
528 the years, which are supposed to bring several improvements in terms of speed, accuracy,
529 and computational efficiency. Combining different models is also effective, in the case
530 of [Deepti and Prabadevi, 2024], they combined transformer architecture with YOLOv7
531 to enhance its feature extraction, this resulted in an increase of 5.4% in mean average
532 precision and F1 score.

533 **3.5 Computer Vision Theory**

534 There are fundamental concepts that need to be done for image processing in detection.
535 There are pre-processing techniques like preprocessing and segmentation. Pre-processing is
536 a general term for preparing an image to be analyzed by the system, this includes techniques
537 such as denoising an image, applying filters, and enhancing the image to further improve
538 the visibility of defects [Lee and Tai, 2020] . Segmentation is dividing the images into
539 segments to make the analysis simpler, methods such as histogram segmentation and active
540 contour models helps in isolating the regions of interest.

541 For defect classification, feature extraction is important to identify the relevant features
542 then extracting said features to help indicate specific defects, this utilizes the edges,
543 textures, and shapes to help in defect classification [Wu et al., 2024]. BY utilizing OpenCV
544 and deep learning models is advisable for automatic feature extraction. Models like CNN,

545 can automatically extract features from images, which greatly reduces the need for manual
546 extraction, this helps in a more robust and scalable solution [Bali and Tyagi, 2020]. The
547 versatility of OpenCV library which allows support for multiple image pre-processing tasks,
548 when combined with deep learning models can be applied to different fields.

549 **3.6 Performance Evaluation**

550 Accuracy, precision, recall, and F1 score are common measures to assess how well clas-
551 sification models predict. Accuracy measures how good a model is by computing the
552 ratio of correct predictions to all predictions. While appropriate for balanced datasets,
553 accuracy can be deceptive when dealing with imbalanced classes, since a model can be very
554 accurate by predicting the majority class. Precision measures how well positive predictions
555 are obtained by calculating the number of correct predicted positive instances. This is
556 particularly important when false positives are costly, such as in the case of spam. Recall,
557 or sensitivity, measures how well a model identifies true positive instances, which is very
558 important in cases where failing to detect a positive instance is costly, such as in medical
559 diagnosis. Since precision and recall trade off each other, the F1 score reconciles the two by
560 computing their harmonic mean. This measure is particularly appropriate when a trade-off
561 between precision and recall is desired, so that neither false positives nor false negatives
562 dominate the assessment. In general, these measures provide a general impression of how
563 good a model is and help decide how well-suited the model is for different applications.

564

3.7 Existing Technologies and Approaches

565

The paper done by [Lualhati et al., 2022], is a green coffee bean sorter that utilizes MATLAB as its image processing. The system created uses a PID based algorithm and image processing algorithm for sorting. The system utilized two cameras to capture both sides of the bean. The system of Lualhati et al. comprises only 3 green coffee bean classifications, which are good, black and deformed coffee beans. The developed system uses multiple stepper motors for the defect sorting, while 2 cameras were used to handle the green coffee bean detection.

566

567

568

569

570

571

572

The paper of [Balay et al., 2024], is an automatic sorting for green coffee beans utilizing computer vision and machine learning for defect classification. The system developed uses the YOLOv8 model alongside a Raspberry Pi based image processing to identify and classify the green coffee beans. The defects that the group classified are full black, partial black, chipped, dried cherry, shell, and insect damage. The system developed uses a conveyor belt and sorting motor for an automated defect separation. They used one camera module, the raspberry pi camera module 3 NoIR for the defect detection of the system.

573

574

575

576

577

578

579

3.8 Density Measurement

580

In measuring the density of the coffee bean there are a number ways this can be done, one way is by measuring the bulk density of the batch. This is done by measuring the mass of a

581

582

583

584

585

as the ratio of the mass of the coffee beans to the volume they occupy after being allowed to flow freely into a container. It is expressed in grams per liter or kilograms per cubic meter.

$$d = \frac{m_2 - m_1}{V} \quad (3.1)$$

586 where m_2 is the mass of the green coffee bean, m_1 is the mass of the empty con-
587 tainer, and V is the capacity (in liters) of the container [International Organization for
588 Standardization, 1995].

589 3.9 Summary

590 This chapter gives the theoretical and conceptual backgrounds of an automated green coffee
591 bean sorter using Artificial Intelligence (AI), Quality Assurance, and Computer Vision. The
592 theoretical background focuses on key concepts like deep learning models (CNNs, YOLO)
593 used for defect classification, quality assurance principles (GAP, GMP, HACCP) ensuring
594 food safety, and computer vision algorithms (preprocessing, segmentation, and feature
595 extraction) used for image analysis. The conceptual background explains the integration of
596 machine vision for defect detection with embedded systems for sorting, thus conforming to
597 the SCAA coffee grading standards. Performance metrics like accuracy, precision, recall,
598 and F1 score are used for evaluating the performance of the model. Current technologies, for
599 instance, those of [Lualhati et al., 2022] and [Balay et al., 2024], provide insights relevant
600 to image processing and machine learning-based sorting techniques, thus contributing to
601 automated coffee bean classification development.

602

Chapter 4

603

DESIGN CONSIDERATIONS

604 **4.1 Mechanical Design**

605 **4.1.1 Screw Feeder**

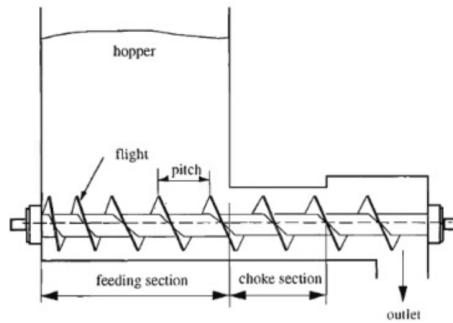

Fig. 4.1 Screw Feeder Diagram

606 Figure 4.1 shows the diagram of a screw feeder. Screw feeders are usually used in
607 industrial fields like agriculture, chemicals, plastics, cements, poultry and food processing.
608 According to [Minglani et al., 2020], screw feeders are specifically used to transport or
609 move granular materials at a controlled rate like corn and wheat. It consists of a rotating
610 screw and small feeding section or the hopper. Despite having big batches of a certain
611 material, screw feeders can control the rate of which these materials are dispensed. With
612 this concept, the group decided to utilize a screw feeder as the input mechanism for the
613 system. This mechanism allows a controlled rate of coffee bean dispensing, which is a
614 significant factor to avoid overcrowding in the rotating conveyor table causing the beans to
615 jam. In addition, batches of coffee beans can be put at once instead of just adding a certain
616 amount of beans at a time.

Fig. 4.2 Rotating Conveyor Table 3D Design, 32-inch Rotary Table Accumulator (RTA)

4.1.2 Rotating Conveyor Table

After the inputted beans come out from the screw feeder, the coffee beans would then be placed in the rotating conveyor table. According to the study of [Dabek et al., 2022]. The conveyor table is used as a transportation system for all forms of bulk materials to a certain machine or destination. The system utilizes the rotating conveyor table to have a controlled movement of coffee beans towards the first stage of the system. The improvised linearization system, consisting of metal guide rails and dividers ensures that beans align in a single path, reducing random movement, and improving the flow of the input beans. An infrared sensor would detect each bean as it passes, to control the movement of the bean preventing clogging and ensuring efficient operation.

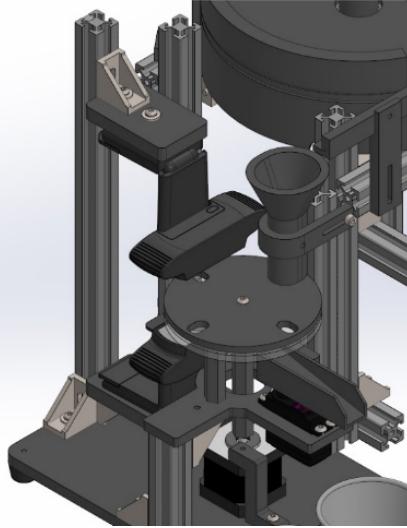

Fig. 4.3 Inspector Tray 3D Design

627 **4.1.3 Inspection Tray (1st Stage)**

628 The inspection tray serves as the platform for the machine vision based analysis of coffee
629 beans. It is designed with 8 holes, allowing uniform placements and optimal camera
630 positioning for the system. The system utilizes a two-layer structure: a stationary acrylic
631 platform and a rotating 3D-printed platform with holes. The rotating mechanism sequen-
632 tially positions each bean between two webcams, which captures and analyzes its physical
633 characteristics from top and bottom perspective. This design captures both sides of the
634 bean, ensuring a better classification of the bean. After inspection, the bean moves onto a
635 slide, where it is either directed to the second stage for density analysis (Good) or sorted
636 out as a defect.

637 **4.1.4 Density Sorter (2nd Stage)**

638 In measuring the density of the coffee bean there are a number ways this can be done, one
639 way is by measuring the bulk density of the batch. This is done by measuring the mass of a
640 batch then dividing it to a fixed volume. The more appropriate method for measuring the
641 density of the coffee bean is called “free settle” density or free-flow density. This is defined
642 as the ratio of the mass of the coffee beans to the volume they occupy after being allowed to
643 flow freely into a container. It is expressed in grams per liter or kilograms per cubic meter.

644 **4.2 Embedded Systems**

645 **4.2.1 Microcontroller**

Fig. 4.4 Arduino Nano Microcontroller

646 Since the system is composed of two stages of sorting: defect sorting through computer
647 vision and density-based analysis—the group decided to utilize two Arduino Nano micro-
648 controllers to modularize the control process. The first Arduino Nano microcontroller is
649 tasked to handle the computer vision-based defect sorting through serial communication
650 with OpenCv operating in Python. In addition, it handles the operation of defect sorting

De La Salle University

651 consisting of a stepper motor for the rotation of the inspection tray and a servo motor for the
652 slider, which directs the beans to the designated bin (defect or good bin). On the other hand,
653 the second Arduino Nano microcontroller manages the density-based analysis and sorting,
654 which consists of another stepper motor to direct the beans to its respective bin (dense
655 and less-dense bin), the precision scale which is interfaced through RS232, and the top
656 feeder where the input beans are poured. The use of separate Arduino microcontrollers is
657 advantageous when it comes to the computer vision-based sorting of beans. This is because
658 serial communication is much faster when code complexity is significantly reduced. With
659 this, a designated microcontroller handles the computer vision part and two-way serial
660 communication between the microcontroller and the computer vision algorithm running in
661 Python. Most importantly, the use of two microcontrollers allowed the system to not rely
662 solely on a sequential approach. This means that the two stages of sorting are not relying
663 on the timing of each other, allowing the inspection tray and the top feeder to operate
664 independently. Thus, resulting in a much faster and efficient sorting process.

665

4.2.2 Sensors

Fig. 4.5 Infrared Sensor

666

To ensure that the beans are falling in a one-by-one manner onto the inspection tray, the group placed an IR sensor at the edge of the top feeder. This IR sensor triggers the DC motor that runs the feeder to stop, and runs small steps until the bean is dropped. The addition of the IR sensor at the edge of the feeder allows the motor to run continuously until another bean is detected. With this, the waiting time for the next bean at the inspection tray is significantly lessened.

Fig. 4.6 TOF10120

672 TOF10120 or Time of Flight sensor is utilized in the system due to its high precision,
673 non-contact measurement capability. This sensor is used to estimate the volume of each
674 bean, which is essential for computing the density. In the second stage of sorting, where
675 beans are classified based on density, the sensor plays a crucial role in determining the
676 approximate volume of each bean by measuring its height or dimensions as it passes
677 through the system.

678

4.2.3 Motor control

Fig. 4.7 12V NEMA 17 Stepper Motor

679

Two NEMA 17 12V stepper motors, paired with L298N motor drivers were used to control the movement of the inspection tray in the first stage and the density-based sorting mechanisms in the second stage. In these mechanisms, the group decided to use stepper motors to ensure precise and accurate movements. Precise and accurate movements are needed for the inspection tray to make sure every movement of the hole is perfectly aligned to the camera. Thus, allowing a more uniform and consistent angle for each bean to be inspected through the computer vision. In addition, NEMA 17 stepper motors were the best choice for these mechanisms due to its high torque, which is essential because it will be moving weighted objects.

Fig. 4.8 6V DC Motor

688 For the rotating conveyor table (top feeder), where the beans are initially poured, a
689 6V DC motor is used. The group decided to use this motor due to its high RPM, which
690 is needed for a fast rotation of the rotating conveyor table. The speed of the feeder is
691 regulated to prevent clogging and ensure that the beans are evenly spaced before they
692 enter the inspection tray. The motor speed is fine-tuned through pulse-width modulation
693 (PWM) to synchronize with the stepper motor-driven inspection tray, ensuring a steady
694 input without overwhelming the system.

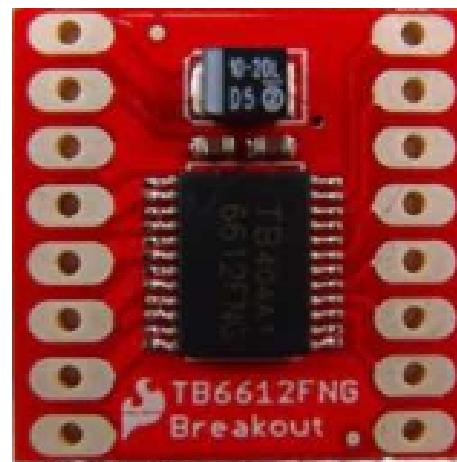

Fig. 4.9 TB6612FNG Motor Driver

695 To drive the 6V DC motor, the group utilized TB6612FNG, a motor driver module.
696 This module also allowed PWM control for the motor, which is essential for reducing the
697 speed of the motor when needed.

698 **4.2.4 Operating Voltage**

Fig. 4.10 12V Power Supply

699 The main power supply comes from a 12V external power supply, which provides enough
700 voltage for all the components and keeps the voltage from dropping and interfering with
701 system performance. The Arduino microcontroller is powered via its VIN pin, so it can
702 function without the need for a USB connection and maintains a stable 5V logic output
703 for sensor and actuator control. The NEMA 17 stepper motors that operate the inspection
704 tray and density sorter are directly powered from the 12V supply and fed into L298N
705 motor drivers to adjust voltage and monitor current flow. Operating these motors at 12V
706 provides best torque output, which is vital in ensuring consistent movement during the
707 sorting process.

Fig. 4.11 MT3608 Step-Up Module

708 For the top feeder mechanism, a step-up module is needed to supply the sufficient
709 voltage needed for the motor–6V. From the 5V output of the Arduino, the step-up module
710 will be utilized to convert it into 6V.

711 **4.3 Computer Vision System**

712 **4.3.1 Image Processing**

Fig. 4.12 C920 Camera

713 The system requires clear images of the coffee beans for accurate processing by the detection
714 and classification models. Two C920 cameras will be used to capture images from opposite
715 sides of each bean—one positioned on top and the other at the bottom. The captured images
716 will then be processed within the laptop using the detection and classification models to
717 identify and categorize the beans.

718 **4.3.2 Object Detection and Classification Models**

719 The object detection model identifies and isolates the coffee beans from the background.
720 For this task, different models were explored:

721 **1. RF-DETR**

722 A transformer-based object detection model that eliminates the need for anchor boxes,
723 improving small object detection.

724 **2. YOLOv11**

725 A CNN-based YOLO variant that incorporates the C3k2 block, SPPF, and C2PSA
726 components to enhance feature extraction and detection accuracy.

727 **3. YOLOv12**

728 The latest YOLO version and attention-centric model that integrates transformer-
729 based components to enhance performance while maintaining real-time efficiency.

730 **4.3.3 Object Classification Models**

731 Following detection, each identified coffee bean was cropped and classified based on its
732 defect type. The classification models used included:

733 **1. EfficientNetV2**

734 A convolutional neural network (CNN) designed for high efficiency and accuracy,
735 balancing computational cost and performance.

736 **2. YOLOv8**

737 A lightweight yet highly accurate model that supports both object detection and
738 classification, making it suitable for real-time applications.

739 **3. YOLOv11**

740 A classification-specific adaptation of YOLOv11, leveraging enhanced feature ex-
741 traction techniques for defect recognition.

742 **4. YOLOv12**

743 A classification variant of YOLOv12, incorporating advanced attention mechanisms
744 to improve accuracy.

745 **4.4 Serial Communication**

746 Serial communication is used for sensors and motors for arduino due to the simplicity,
747 reliability and efficient transfer of data between different devices. The precision scale uses
748 a RS232 and a MAX TTL converter to send the data from the precision to the arduino
749 to get the weight values of each green coffee bean. To sort out the good from defective
750 beans the system utilizes a servo motor. The data from python is received by the arduino
751 through serial communication. The python side is responsible for the decision and defect
752 classification while the arduino is responsible for controlling the servo motor.

753

4.5 Graphical User Interface (GUI)

Fig. 4.13 Graphical User Interface

754 The proposed system would be integrating a graphical user interface developed using
755 PyGui and ChatGPT API. The GUI would serve as the control center platform for the
756 system. This would provide real-time feedback and insights for users. As shown in Figure 8,
757 a concept of how the GUI would interact with the system would be a start button, once the
758 button is executed the system would then be expecting inputs and start sorting. There would
759 be real-time feedback during the sorting process, then some visual markers to indicate their
760 classification, and an elapsed time so the user would be aware of the time of the sorting
761 process. Once the system is done, the user can click the end button and the summary report
762 would generate in an orderly manner, providing tables of classification that was detected
763 through the process. In the bottom part of the GUI, ChatGPT API would be integrated and
764 would offer recommendations based on the detected quality and classification of the coffee
765 beans.

4.6 Density Analysis

The density analysis works by using a precision scale to measure the mass of the bean. To get the data from the precision scale, serial communication is used from the scale to an arduino nano. This is done by using a RS232 with a Max TTL converter for the arduino to read the data from the precision scale. To sort out the good from defective beans the system utilizes a servo motor for the density sorting mechanism. The servo motor is used to sort the dense from the less dense beans. The sorting mechanism developed consists of gears and cross-shaped modules to properly capture the beans and properly sort them out.

4.7 Technical Standards

4.7.1 Hardware

In the design and development of the system, the group incorporated and followed a series of technical standards. One of which is ISO 12100:2010 – Safety of Machinery, where general principles for risk assessment and reduction are discussed. Thus, the system is designed, while keeping in mind the hazards associated with moving parts, making sure that all moving parts in the system do not need to be touched for operations. An emergency stop is also integrated into the system to stop all the moving parts in case of undesirable incidents [International Organization for Standardization, 2010].

On top of this, ISO 14121-1 – Risk Assessment for Machinery was also followed to further assess the potential risks throughout the system. The standard includes identifying and quantifying hazards such as electrical short circuits, faulty wirings, and motor overheating [International Organization for Standardization, 2007]. With this, the system

787 included protective enclosures for the electrical wirings, proper grounding of the circuits,
788 and controlled motor actuation. More specifically, for motors, it was made sure that the
789 design has sufficient voltage and ampere to power the different kinds of motors used with
790 the use of L298N, and MT3608 modules. These are the main components for adjusting
791 motor speeds dynamically during the sorting process.

792 Lastly, ISO 30071-1 was standard used to provide sufficient lighting during data
793 collection, and real time bean inspection during sorting process. This standard helps ensure
794 consistent and non-glare lighting conditions, which are essential for the machine vision
795 cameras to accurately capture bean features [International Organization for Standardization,
796 2019]. Uniform illumination improves the reliability of image classification by reducing
797 shadow artifacts and reflections, thereby enhancing overall detection performance.

798 **4.7.2 Software**

799 For the software side of the system, the first applicable standard is ISO/IEC 25024 – Sys-
800 tems and Software Engineering – Measurement of Data Quality, which offers a systematic
801 method for measuring the quality of datasets utilized in information systems [International
802 Organization for Standardization, 2015]. This standard was used during the dataset gather-
803 ing and training for the different coffee bean defects like black, sour, insect damage, fungus
804 damage, broken, floaters, and dried cherry. Practically, this included pre-processing the
805 image data to eliminate noise, balance class distribution, and verify ground truth labels.

806 Lastly, ISO/IEC 23053 – Framework for Artificial Intelligence (AI) offers a reference
807 architecture to build and integrate machine learning building blocks [International Organiza-
808 tion for Standardization, 2022]. This standard was highly applicable in determining the
809 design of the machine vision module, where a pre-trained deep learning model is utilized

810 for the classification of bean defects. This standard provides guidelines on best practice for
811 the overall machine learning cycle, ranging from data acquisition, feature extraction, and
812 model training through to model evaluation, deployment, and monitoring.

813 **4.7.3 Green Coffee Bean Sorting**

814 For sorting green coffee beans, Specialty Coffee Association of America (SCAA) Standards
815 for Green Coffee Bean Sorting was incorporated to maintain conformity. The standards
816 set the definition for the classification of primary and secondary defects (i.e., black, sour,
817 insect-damaged, broken, and floater beans) and sets the maximum allowable defect counts
818 for specialty-grade coffee. The SCAA standards were applied to mark the training set of the
819 machine vision model and also to set up the thresholds of defect classification, so visually
820 defective beans can be correctly classified and rejected. Also, the sorting mechanism based
821 on density points towards SCAA bean weight and volume guidelines using a precision
822 scale and ToF sensor to sort beans based on within-acceptability density limits.

823 On the other hand, the system also adheres to PNS/BAFS 341:2022, the Philippine
824 National Standard for Agricultural Machinery – Coffee Green Bean Grader – Specifications
825 and Methods of Test [Bureau of Agriculture and Fisheries Standards, 2022]. It sets local
826 criteria for testing coffee grading equipment on performance, safety, construction aspects,
827 and methods of test. For the purposes of this research, PNS/BAFS 341:2022 is used as a
828 reference for the design of the sorting mechanism, specifically in terms of the materials
829 used in construction, handling of beans, and the efficiency with which the mechanical and
830 electronic subsystems segregate. It also guides the testing procedure employed to verify
831 sorting precision, capacity, and rates of misclassification under test conditions.

832

834

5.1 Description of the System

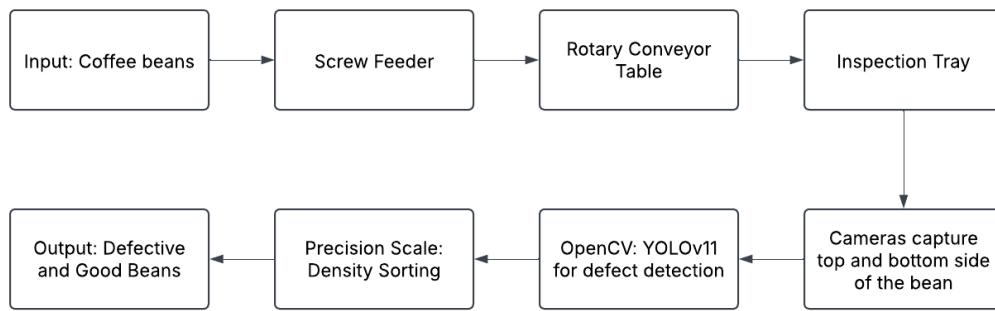

Fig. 5.1 System Block Diagram

835

The proposed system is a two-staged automated green coffee bean sorting machine, integrating both machine vision and density analysis. Firstly, the coffee beans are introduced into the system through a funnel, which directs them to a conveyor belt mechanism. In the first stage, the green coffee beans will be sorted depending on their visual characteristics. In this stage, the physical qualities of the bean is analyzed such as size, color, and defect. If the bean is defective, the system will automatically sort it out. Then, all the non-defective beans will go through the second stage of the system. In the second stage, there will be an IR sensor and a weighing scale. The IR sensor will help the system to calculate for the estimated volume of the bean. The volume and mass of the bean in hand, the density of the bean can be calculated. Depending on the density threshold and size threshold set by the user, the bean will be classified whether it is good or not.

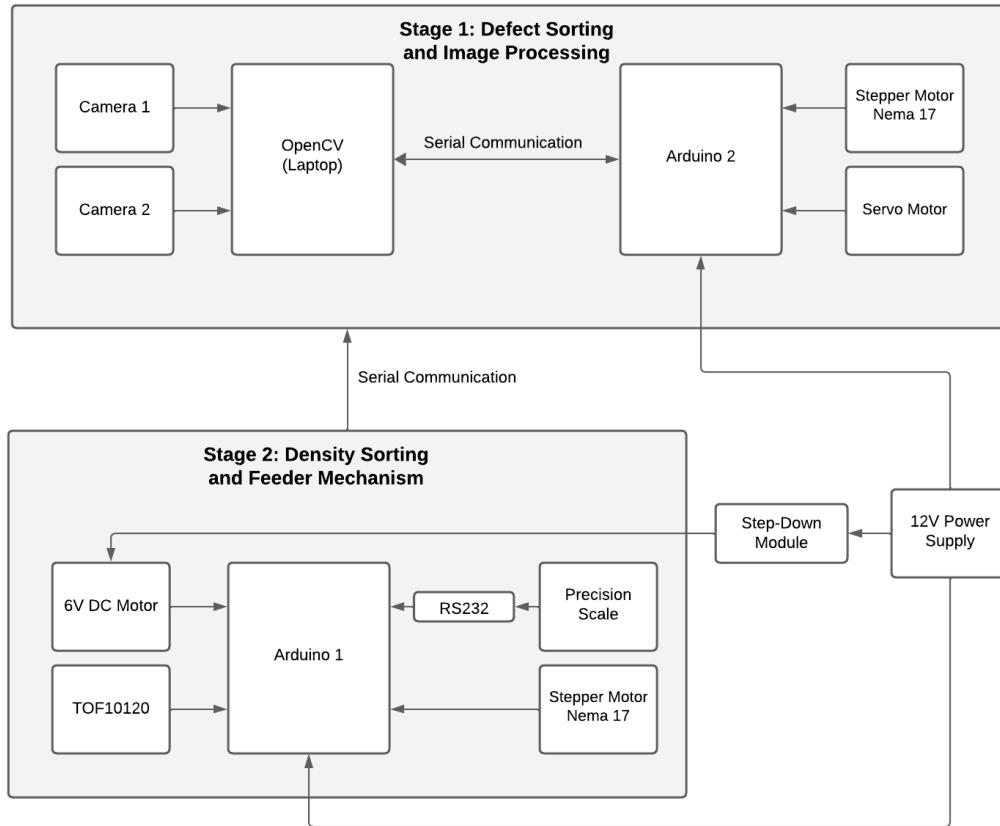

Fig. 5.2 Schematic Diagram of the System

Figure 5.2 shows the schematic diagram of the proposed system. Arduino Uno microcontroller makes all the mechanical components such as the servo motor, stepper motors, and the conveyor belt. The servo motor controls the rotating mechanism for bean sorting. On the other hand, the stepper motors operate a slide mechanism to direct the beans. Two cameras, integrated with OpenCV via Python, handle machine vision algorithms, and image processing for defect detection of the beans. A ToF10120 sensor provides precise distance measurement. A precision weighing scale measures the density of each bean for classification. The Arduino communicates with the OpenCV system through serial

854 communication, ensuring smooth coordination.

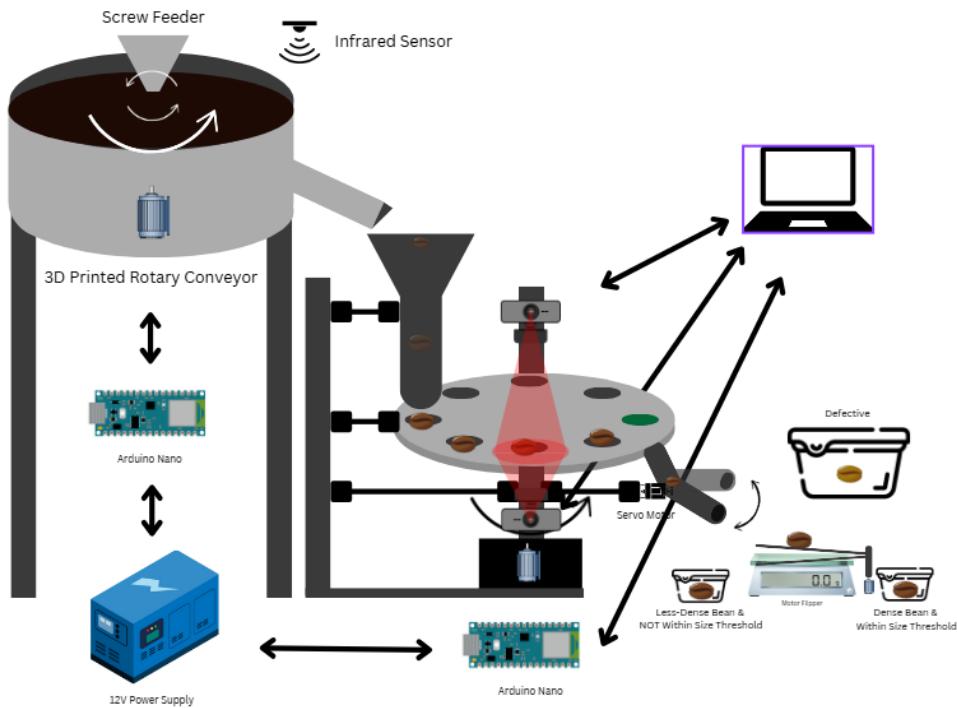

Fig. 5.3 Design Overview of the System

855 Figure 5.3 shows the design overview of the system. Beans are first arranged through a
 856 hopper and a conveyor belt. On top of the conveyor belt, a 3D-printed guide is attached for
 857 the beans to maintain a linear formation. Then, the beans are expected to fall into another
 858 funnel attached to a tube. The tube is directly attached to a rotating mechanism that allows
 859 the beans to be inspected and sorted one-by-one. In this stage, defective beans are sorted
 860 out. Then, the non-defective beans are transferred onto the precision scale to analyze the
 861 density. The less-dense beans are sorted out of the batch.

862

5.2 Research Design

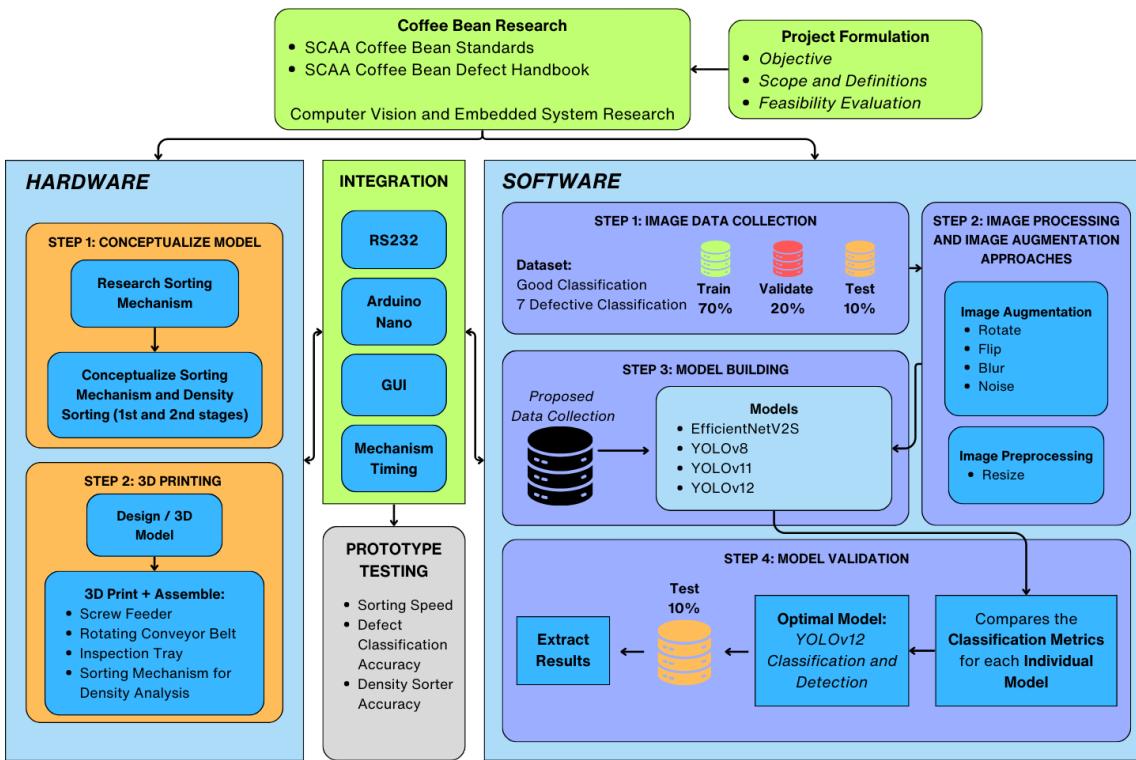

Fig. 5.4 Design and Development Research (DDR) Methodology

863

The researchers opted for a Design and Development Research model for the research.

864

As shown in Figure 5.4, there are multiple levels that were needed in order to develop a

865

working prototype for the system.

866

5.3 Dataset Collection

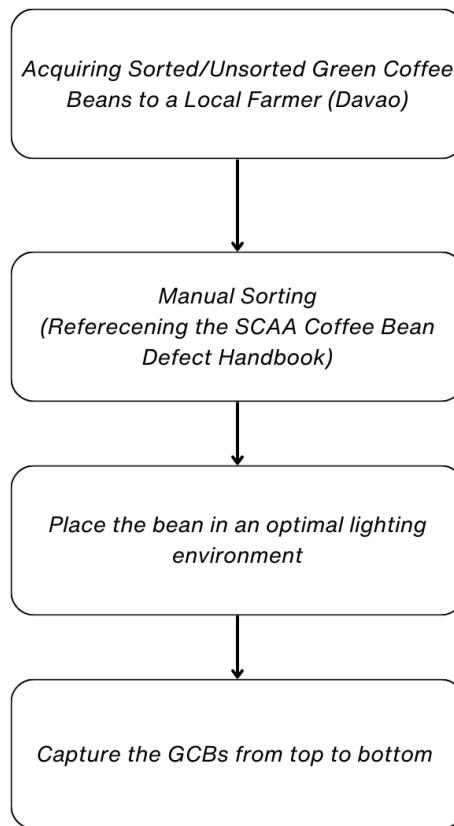

Fig. 5.5 Data Collection Process

867
868
869
870
871
872
873

For dataset collection, Arabica green beans from a farm will be used. Each bean will be captured by a high-resolution camera under sufficient and consistent lighting. Proper lighting is crucial, as it directly affects the visibility of the bean's physical features, minimizing shadows, grain, and other noise that could result from inconsistent illumination. The top and bottom side pictures of the beans are to be collected. In addition, defective beans of the same type and origin will be gathered to identify the different classification of defects (primary and secondary). This study focuses on defects such as Broken, Dried Cherry,

874 Floater, Full Black, Full Sour, Fungus Damage, and Insect Damage. The dataset will
 875 include at least 500 images of good beans and a minimum of 200 images for each defect
 876 category. To expand the dataset and enhance model training, augmentation techniques such
 877 as scaling, rotation, and mirroring will be applied.

878 **5.3.1 Dataset Collection and Model Training**

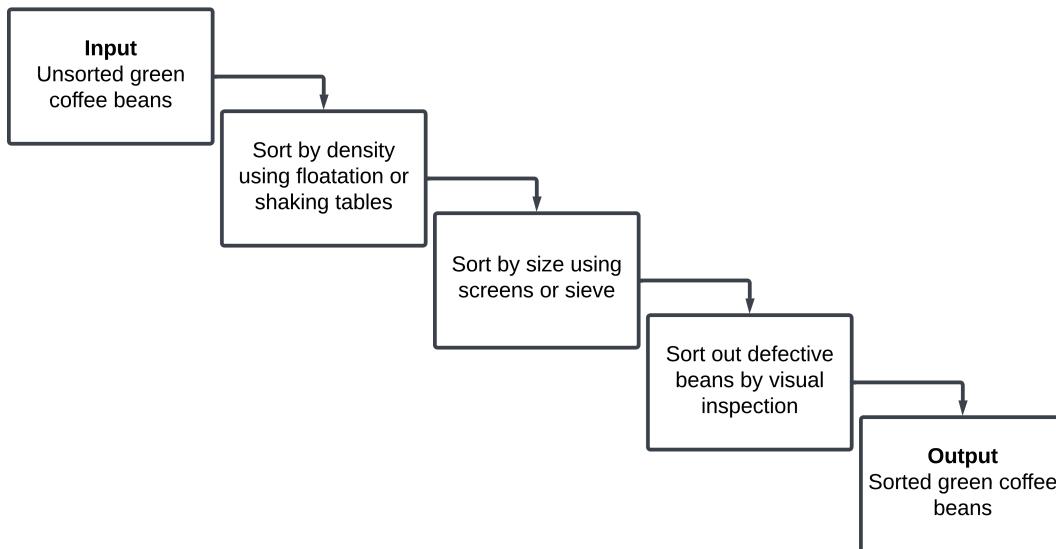

Fig. 5.6 Manual Sorting Process

879 The diagram in Figure 5.6 depicts the representation of the process of manual sorting of
 880 unsorted green coffee beans through a series of steps. First, the beans are sorted by density
 881 using methods such as floatation or shaking tables. This helps in separating the denser
 882 beans, usually pertaining to a more developed and higher quality bean. Then, the beans are
 883 sorted by size using screens and sieves with specific dimensions depending on the variety
 884 of the beans. After this, a thorough visual inspection is performed by the sorters to identify
 885 and remove the defective beans from the batch. To ensure consistency and accuracy, the

886 group follows the Specialty Coffee Association of America (SCAA) Standards Defect
887 Handbook, which provide documentation and guidelines for identifying and classifying
888 defective beans. Finally, the process results in the output of sorted green coffee beans,
889 ready for further processing or sale. To ensure the dataset reflects real-world conditions, the
890 group acquired Arabica green coffee beans from Davao. These beans were manually sorted
891 to properly classify defective characteristics before capturing images for dataset creation.
892 This step was crucial for improving the efficiency of batch image capture and ensuring
893 accurate model training, making the system more applicable to Philippine coffee producers.

894 **5.3.2 Utilization of Open-Source Database**

895 To establish a foundation for the system's model, the group initially referenced an open-
896 source dataset from Kaggle. This dataset provides an original 500x500px images of Arabica
897 green coffee beans categorize as defective or good. This dataset also provided insights into
898 how individual beans were captured, including factors such as lighting, camera positioning,
899 focus, and resolution. By analyzing the dataset, the group gained a better understanding
900 of how to achieve a high-quality data collection, ensuring that the collected dataset would
901 contribute to high model accuracy when it is fed into the system.

902

5.3.3 First Iteration of Dataset Collection

Fig. 5.7 First Iteration of Data Collection Setup

De La Salle University

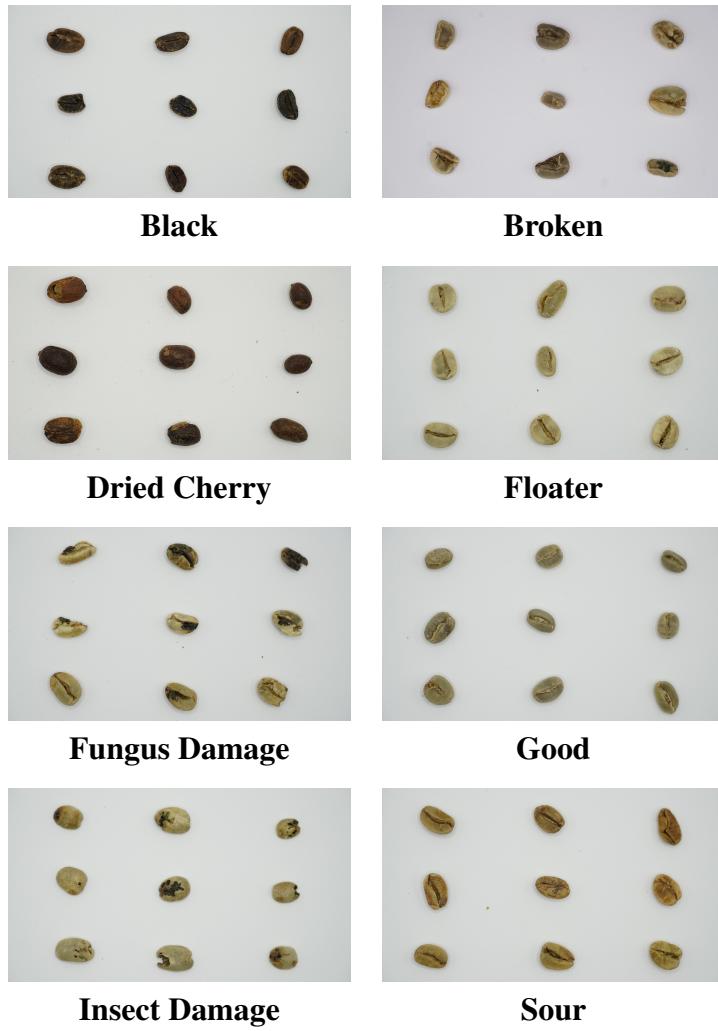

Fig. 5.8 Sample Images from the First Iteration of Dataset Collection

903 The first iteration of data collection utilized a Sony A6300 camera with its Kit Lens, set
904 at 1/200 Shutter Speed, 1000 ISO, and a Distance of 50mm. The beans were captured in
905 batches of nine, carefully arranged within the camera's field of view following the rule of
906 thirds. The rule of thirds is a photographic composition principle where an image is divided
907 into a 3x3 grid, creating nine equal grid lines to create balance to the photo. By aligning

908 the coffee beans with the rule of thirds, the group ensured a structured and even distribution
909 of the beans within the frame. This setup also made it easier to automate the cropping
910 process, as the predefined positions of the beans allowed a Python script to accurately
911 extract individual images.

912 **5.3.4 Second Iteration of Dataset Collection**

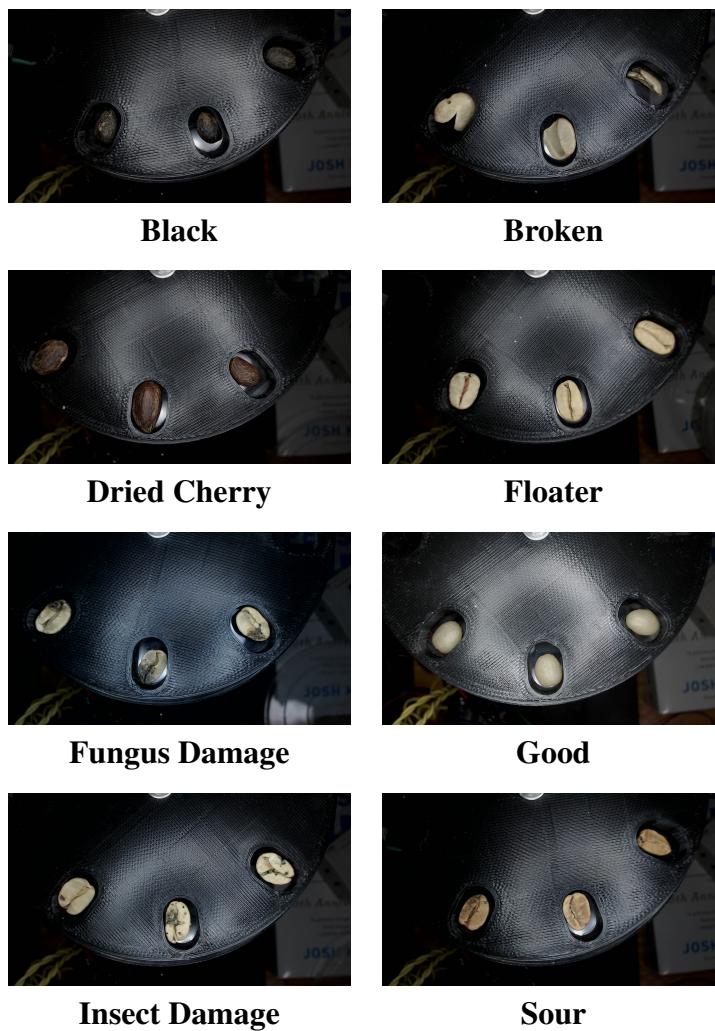

Fig. 5.9 Sample Images from the Second Iteration of Dataset Collection

913 The second iteration focused on real-world implementation, using the system's built-in
914 webcam to capture images directly from the inspection tray. This setup represents the
915 ideal condition, as it replicates the actual environment where the model will operate. The
916 images captured in this iteration directly reflect what the system will process in a practical
917 application, allowing for better generalization and real-time adaptability.

918 **5.4 Density Threshold Calibration Using Water Dis- 919 placement Method**

920 Setting the threshold for bean density is crucial for the stage 2 sorting of the system, which
921 involves measuring the density of each bean. In order to set a threshold for density-based
922 classification, a calibration batch of Good quality coffee beans was chosen. The beans were
923 confirmed to be free of defects and representative of typical specialty-grade coffee by the
924 farmer. The threshold density was calculated by determining the average density of this
925 batch through direct measurements of mass and volume.

926 The total volume of the batch of beans was measured by the water displacement
927 technique, a commonly used method to measure the volume of solids that are irregularly
928 shaped. The beans were fully immersed in a water-filled graduated cylinder, and the rise in
929 water level was measured. The volume of water displaced is equivalent to the combined
930 volume of the batch of beans, measured in cubic centimeters (cm^3).

931 The overall weight of the beans was determined by a high-precision digital scale (at
932 least to 0.001 g resolution). Both the mass and volume are known, and the batch density
933 may be calculated through the use of the standard formula for density:

$$\text{Batch Density} = \frac{\text{Total Mass of Beans (g)}}{\text{Total Volume Displaced (cm}^3\text{)}}$$

934 This computed average density served as the threshold value in the system. During
 935 automated classification, individual bean density is calculated using estimated volume (from
 936 image analysis) and actual weight (from the precision scale via RS232 communication).
 937 Beans with a density lower than the threshold are classified as less dense, while those
 938 meeting or exceeding the threshold are considered dense, indicating higher quality.

939 **5.5 Dataset Preparation and Model Training**

940 **5.5.1 Dataset Splitting**

941 The dataset is divided into train, validation, and test sets in a 70-20-10 ratio. The training
 942 dataset will be used for model learning, which allows it to identify patterns in the image.
 943 The validation set is used to assess the model's performance and fine-tune the parameters
 944 of the model during training. This is an iterative process wherein the model learns from
 945 the training data and is then evaluated on and fine-tuned on the validation dataset. Finally,
 946 the test set is used for evaluating the model's final performance, assessing its ability to
 947 generalize to new data.

948 **5.5.2 Image Annotation**

949 Roboflow Annotate was used to label images of coffee beans. The platform was used for
 950 two separate datasets: one for the detection model, the other for the classification model.
 951 In the detection dataset, bounding boxes were drawn around individual coffee beans and

952 labeled accordingly. For the classification dataset, the trained detection model was used
953 to crop individual coffee beans from the raw dataset, which were the categorized into the
954 eight different classifications. Roboflow was chosen for its ability to store datasets in the
955 cloud and its support for different annotation formats, such as COCO and YOLO, ensuring
956 compatibility with different deep learning models during experimentation.

957 **5.5.3 Dataset Augmentation Techniques**

958 Data augmentation techniques were applied using Roboflow's tools to improve the model
959 generalization. Different augmentations such as rotation, flipping, blur, brightness and
960 contrast adjustment, and noise were used to simulate variations, which helps prevent
961 overfitting and improve the model's ability to identify defects in different lighting conditions
962 and orientations.

963 **5.5.4 Model Evaluation**

964 Each trained model will be tested on the system, with a predetermined set of beans. The
965 results from this test are analyzed by using a confusion matrix, providing a detailed
966 breakdown of the model's performance for each category. The confusion matrix provides a
967 way to interpret classification results by defining the following parameters:

- 968 • **True Positives (TP)** - The number of correctly classified instances for a specific
969 defect type.
- 970 • **False Positives (FP)** - The number of times a different category was incorrectly
971 classified as this defect type.

- 972 • **True Negatives (TN)** - All correctly classified instances excluding the defect category
 973 in question.

- 974 • **False Negatives (FN)** - The number of times this defect type was classified as
 975 something else.

976 Through these parameters, key performance metrics such as accuracy, precision, recall,
 977 and F1-score were computed to evaluate the system's performance in different classifica-
 978 tions as shown below. This test will assist in determining what types of defects the system
 979 correctly classifies and which types might need improvements in image preprocessing,
 980 dataset expansion, or optimization of the machine learning model. The outcome will be
 981 applied to optimize the sorting algorithm for minimal misclassifications to ensure greater
 982 reliability in real-world defect detection.

- 983 1. **Accuracy** measures overall correctness of the classification model

$$Accuracy = \frac{TP + TN}{TP + TN + FP + FN} \quad (5.1)$$

- 984 2. **Precision** measures how many of the predicted positive classifications were actually
 985 correct

$$Precision = \frac{TP}{TP + FP} \quad (5.2)$$

- 986 3. **Recall** evaluates how well the model identifies actual positive cases

$$Recall = \frac{TP}{TP + FN} \quad (5.3)$$

- 987 4. **F1-score** represents the harmonic mean of precision and recall

$$F1-Score = 2 \times \frac{Precision \times Recall}{Precision + Recall} \quad (5.4)$$

988 **5.5.5 Model Benchmarking and Selection**

989 Several models were trained and tested within the actual system to determine the most
990 effective one. These models trained and evaluated include EfficientNetV2, YOLOv8,
991 YOLOv11, and YOLOv12. Each model was assessed using the defined performance
992 metrics and compared accordingly. The model with the highest overall performance will be
993 selected for deployment in the system.

994 **5.6 Hardware Development**

995 The hardware elements of the system, two-stage automated coffee bean sorter, are devel-
996 oped to provide effective and precise sorting using a mix of mechanical and electronic
997 components. Each element is designed and tested to maximize the sorting process while
998 providing system reliability.

999

5.6.1 Screw Feeder

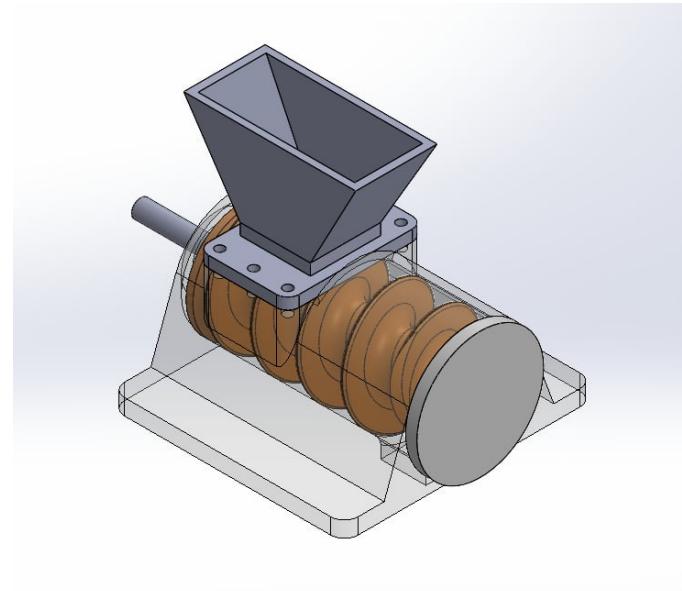

Fig. 5.10 Screw Feeder 3D Design

1000 Screw feeder is the most essential of the devices as it governs the beans of coffee moving
1001 into the system. It operates mostly to deliver the beans consistently in terms of volume
1002 and ensures they do not bundle up and fall into the system in heavy masses, causing beans
1003 build up on the rotating conveyor table. The feeder is driven by a 12V DC motor, and the
1004 rotation speed is regulated using PWM. Through a constant and controlled flow, the screw
1005 feeder avoids clogging and provides a consistent input into the inspection tray, enhancing
1006 overall system performance. Figure 5.10 shows the actual 3D model design of the screw
1007 feeder used in the system.

1008

5.6.2 Rotating Conveyor Table

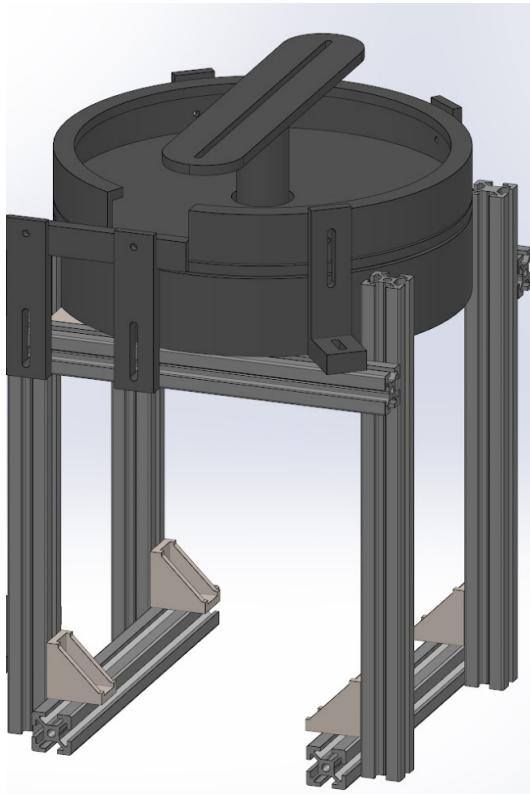

Fig. 5.11 Rotating Conveyor Table 3D Design

1009

The conveyor table, as shown in Figure 5.11, rotates to move the coffee beans from the feeding mechanism to the inspection tray. The table contains aluminum guides to linearly arrange the beans prior to dropping on the inspection tray. The conveyor is powered by a 12V DC motor, which offers consistent movement and regulated speed to avoid misalignment. By incorporating a turning mechanism, the conveyor guarantees beans are well oriented prior to inspection tray entry, minimizing classification errors due to faulty positioning.

1010

1011

1012

1013

1014

1015

Fig. 5.12 Rotating Conveyor Table with Aluminum Guides

1016 As shown in Figure 5.12, the installed aluminum guides on the rotating conveyor table
1017 ensures coffee beans to be linearly arranged. This linear arrangement of beans significantly
1018 helped the system to ensure that coffee beans are dropped onto the slide, which connects
1019 the conveyor table to the inspection try, in a one-by-one manner. In addition, the aluminum
1020 guides are also installed to keep the beans from accumulating in one area, which can cause
1021 the jamming of beans. The researchers tested the different motor speeds to observe the
1022 optimal settings that will not cause bean jamming and meet the minimum sorting speed of
1023 the system.

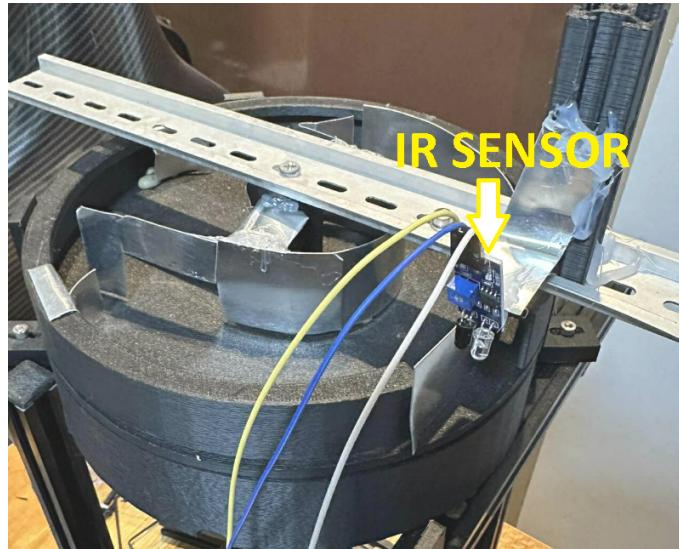

Fig. 5.13 Rotating Conveyor Table with IR Sensor

Initially, the rotating conveyor table is set at a fixed and slow speed to ensure that coffee beans are dropped into the inspection tray one-by-one. However, at this rate, the time travel time of the first bean dropped from the center of the table is very long. Thus, the group decided to add an IR sensor at the edge of the rotating table as seen in Figure 5.13. The sensor's responsibility is to detect if there is a bean at the edge. If there is no bean detected, the rotating table is set to a higher speed to expedite the process. On the other hand, if a bean is detected by the sensor, the rotation of the table is adjusted in such a way that it is able to drop the beans one-by-one onto the inspection tray. With this sensor integrated into the system, a higher speed can be set for the rotating table, minimizing the time travel of the beans from the center to the inspection tray, resulting to a faster sorting time for the first stage.

1035

5.6.3 Inspection Tray

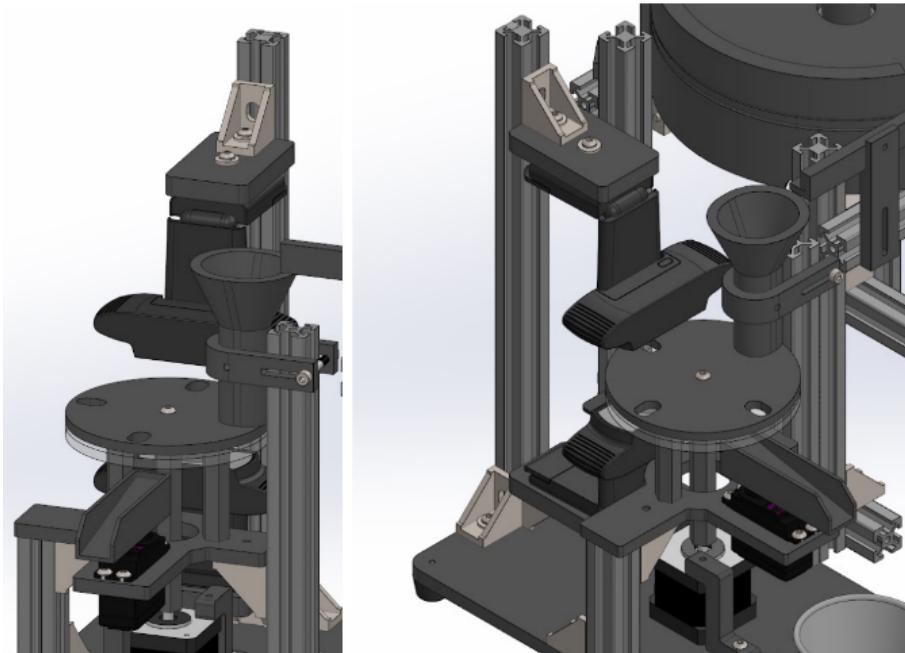

Fig. 5.14 Inspection Tray 3D Design

1036

The inspection tray is the main component for the first-stage sorting mechanism. The inspection tray is used to support beans in a stable and constrained position for a short time, enabling the camera to take high-resolution images without motion blur. The NEMA 17 stepper motor drives the movement of the inspection tray, enabling accurate alignment with the vision system's image processing pipeline. The tray surface is created to reduce reflections and enhance contrast so that the camera can precisely detect defects like cracks, discoloration, or insect infestation. In addition, the surface is made of clear acrylic to allow a clear image for the camera positioned at the bottom of the tray. Lastly, a rotatable slider controlled by a 5V servo motor serves as the main segregator of the good beans from the defective beans.

5.6.4 Density Sorter

The density sorter is the second-stage sorting system, tasked with sorting coffee beans according to their measured density. This is achieved by initially measuring each bean's mass using a precision weighing scale and volume using the ToF10120 infrared sensor. After calculating the density, the system triggers a sorting system powered by a NEMA 17 stepper motor, which sorts beans into various collection bins according to their classification. This sorting operation is such that high-density, specialty-grade beans are kept separate from low-density, commercial-grade or defective beans. The density sorter's accuracy is verified by comparing the results of its classification to manual weighing measurements (ground truth data).

Fig. 5.15 Precision Scale

The U.S. Solid Electronic Precision Balance (0.01g, 1200g capacity, RS232 port, AC/DC power) was selected for the density sorting mechanism because it is highly accurate, transmits data in real-time, and is well-calibrated. Its 0.01g precision guarantees accurate mass readings, which are critical to precise density calculations in sorting coffee beans. The RS232 port facilitates smooth integration with the microcontroller for automatic data

1061 processing and sorting decisions, minimizing manual errors. Its dual power source (AC
 1062 and battery) also guarantees uninterrupted operation in different environments, making it a
 1063 dependable and efficient part of the coffee bean sorting system.

1064 5.7 Hardware and Software Integration

1065 5.7.1 Serial Communication

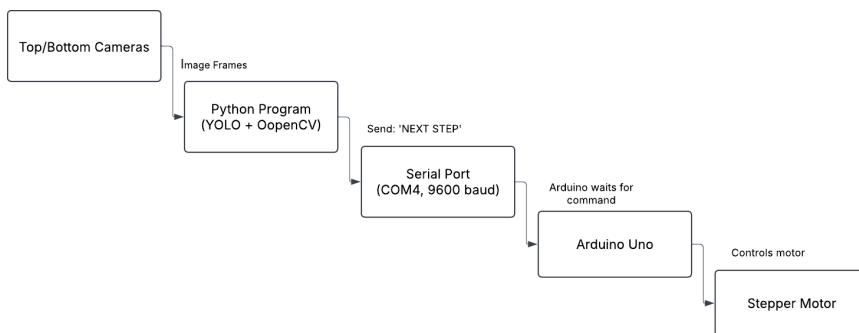

Fig. 5.16 Serial Communication Flow for Stage 1 Classification

1066 The system is generally composed of hardware and software components. Hardware
 1067 components are mainly responsible for collecting data from the coffee beans such as the
 1068 camera and IR sensor, and the sorting mechanisms such as servo motors and stepper motors.
 1069 On the other hand, the software components are the brain of the system which is mainly
 1070 responsible for data processing such as image detection, defect classification of the beans,
 1071 volume and density computation, and control of the mechanisms. Since the system has
 1072 two major components, software and hardware, they should be integrated together for
 1073 the system to be as effective. Thus, serial communication was utilized to integrate the
 1074 hardware and software components of the system. Serial communication is a significant

1075 component in the system as it serves as the communication medium of the hardware and
 1076 software. It enables real-time coordination between the software (YOLO-based image
 1077 detection, classification, and density computation) and the hardware (running in Arduino
 1078 microcontrollers). The said communication is established with the use of a USB serial
 1079 interface using the pyserial library in Python. In addition, this is configured at a baud rate
 1080 of 9600.

1081 5.7.2 Recommended Standard 232 (RS-232)

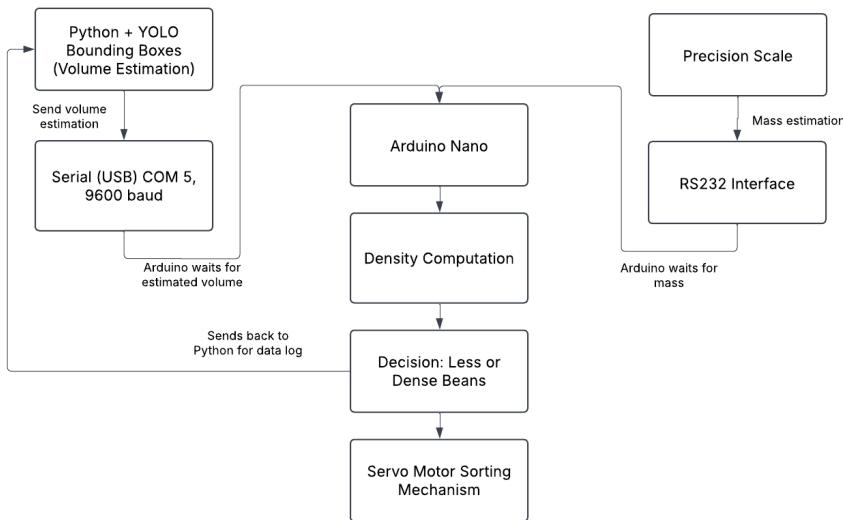

Fig. 5.17 Precision Scale Integration with RS232 for Stage 2 Classification

1082 The stage 2 classification is mainly composed of the sorting mechanism itself, and the
 1083 precision scale to measure the mass of each bean. The bounding boxes from the stage 1
 1084 classification are used to estimate each bean's volume. Additionally, the beans depth is
 1085 also estimated through the IR sensor placed in the rotating conveyor table. With these
 1086 measurements, the volume of each bean, the volume can be calculated using the Tri-axial

De La Salle University

1087 Ellipsoid's volume formula. The system, specifically at the inspection tray mechanism
1088 where the YOLO detection and classification is implemented, has a function move_stepper()
1089 responsible for sending the command from the Python code to the Arduino microcontroller.
1090 When the Arduino receive this command, it executes motor movement that allows the
1091 stepper motor to move at a certain angle that allows the camera to capture the bean.
1092 This function is crucial for the system as this is how each bean in the inspection tray is
1093 fed to the image processing side of the system. This movement rotates the mechanism
1094 holding the coffee beans, positioning the next bean beneath the top and bottom cameras
1095 for inspection. After the motor completes the movement, the Arduino will send back a
1096 message to the program running Python, signalling that the bean is ready for image capture
1097 and further processing. In addition, the Python script is continuously or constantly waiting
1098 for the Arduino's message through the arduino.readline() function, ensuring seamless
1099 communication and faster processing.

5.8 Prototype Setup

5.8.1 Actual Setup

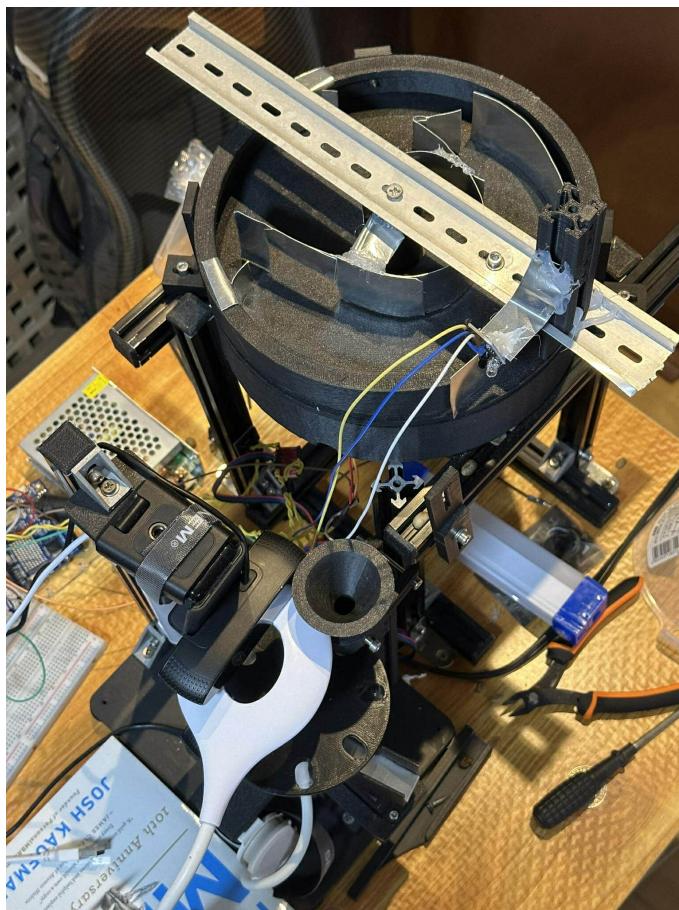

Fig. 5.18 Actual System Setup

Physical integration of the automatic coffee bean sorter system comprises various integrated parts with the purpose of enabling effective, accurate, and methodical sorting in terms of visual defects as well as density categorization. The system involves integration of mechanical, electronic, and computer vision technologies for optimizing sorting. To

begin the process, coffee beans are added to a revolving conveyor table, which is the main mechanism of transport used for feeding the beans into the inspection system. The conveyor features aluminum guides positioned strategically along it to ensure linear alignment of the beans as they travel. Linear alignment is required to avoid overlap and misclassification, since individual processing by the machine vision system is necessary for each bean. Once the beans travel further along the conveyor, they are conveyed onto the inspection tray. There, they are viewed in multiple perspectives by two high-definition cameras. A two-camera imaging process ensures improved defect detection by providing a full, thorough evaluation of the surface, shape, and texture of the bean. The images are then processed with a deep learning-based classification algorithm that classifies each bean as either defective or good according to predefined defect types like black beans, dried cherries, fungus damage, insect damage, sour beans, floaters, and broken beans.

After classification, the system triggers the defect sorting mechanism, which physically takes out defective beans from the processing line. The mechanism includes a servo motor-powered sorting slide, which diverts defective beans into a distinct collection bin. Good beans that are classified are taken to the second level of sorting, which is density-based classification. At the density-based sorting level, good beans are weighed individually with a high-precision electronic balance. The U.S. Solid Electronic Precision Balance (0.01g, RS232) is embedded within the system to accurately weigh the mass of each bean. A Time-of-Flight (ToF) sensor also estimates the volume of each bean, permitting the calculation of the density of beans. According to the calculation of density, beans are automatically sorted into corresponding collection bins using a second sorting mechanism regulated by a NEMA 17 stepper motor.

5.8.2 Lighting Setup for Inspection Tray

Lighting has a key importance in the image-based detection and classification system, specifically for the inspection tray. For the model to be more accurate and precise in classifying good and defective beans, correct lighting is important such that details like surface texture, color difference, and defects are properly rendered by the imaging system. Asymmetrical, unsteady, or low-quality lighting can create shadows, reflections, or over-exposure, all of which lower the quality of input images and thus decrease the accuracy of object detection and classification models like YOLO. To improve the consistency and definition of images taken during inspection, the lighting arrangement above the inspection tray was refined incrementally throughout development. The refinements were intended to maximize the illumination conditions for both the top and bottom camera modules.

De La Salle University

Fig. 5.19 First Iteration of Lighting Setup

Figure 5.19 shows the initial lighting setup that the researchers implemented on the system. The initial lighting arrangement was based on a single top-mounted LED lighting. Although the arrangement was more than bright enough for the top camera, it introduced random shadows and highlights onto the bottom camera. As a result, only one side of the bean is accurately inspected. These random elements impacted the model's performance in detecting bean contours and separating surface flaws, particularly for dark beans or reflective-surface beans.

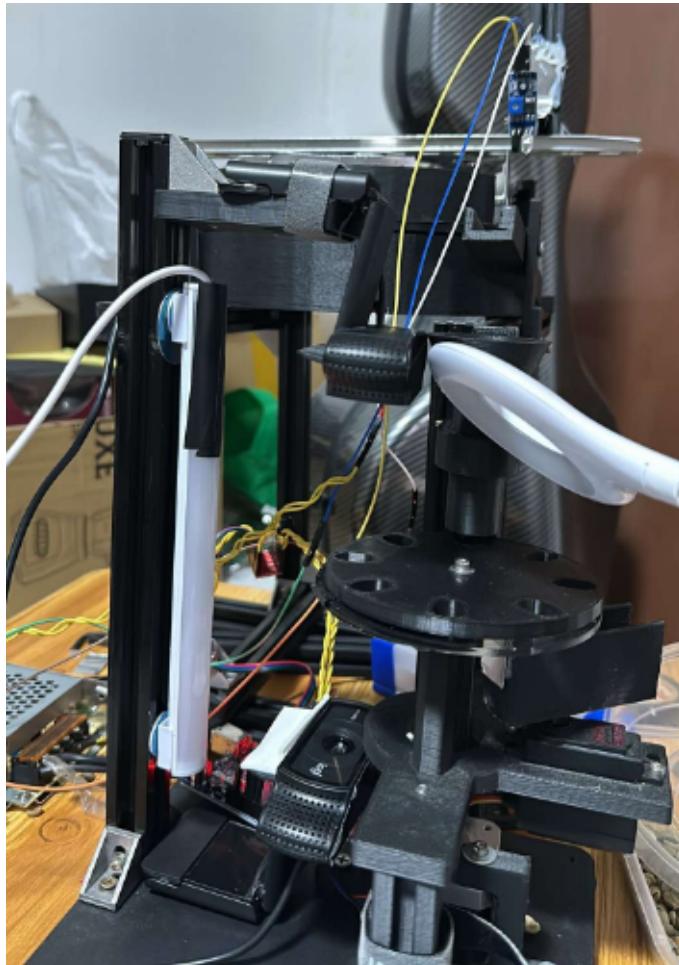

Fig. 5.20 Second Iteration of Lighting Setup

1147 For the second iteration of the lighting setup, the researchers decided to add another
1148 LED strip lighting at the side of the inspection tray, while keeping the LED lighting
1149 mounted at the top. This provided good lighting for both top and bottom cameras. However,
1150 the view of the bottom camera is still a bit dark.

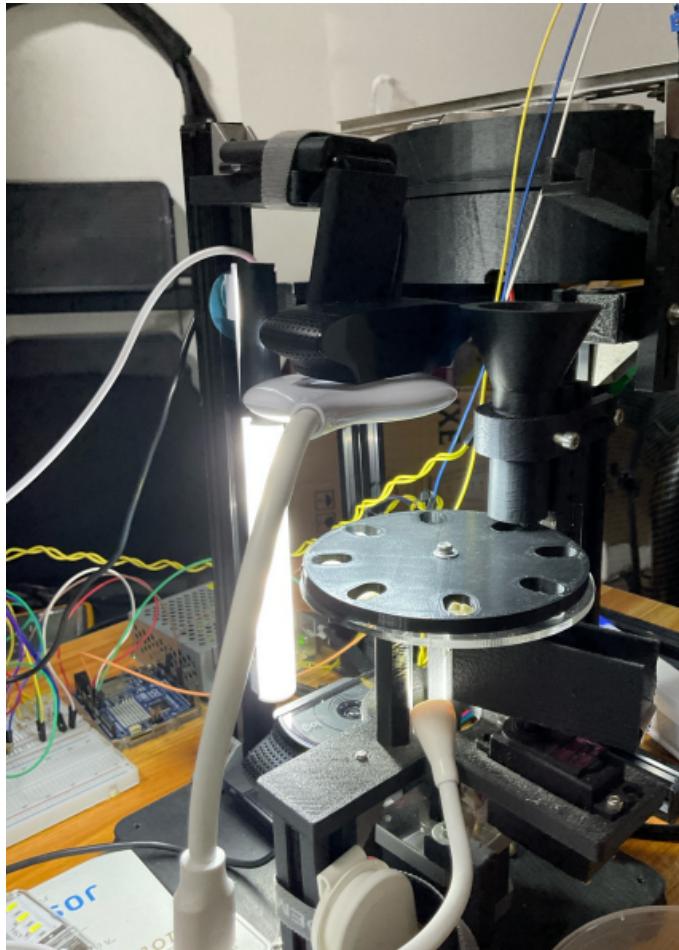

Fig. 5.21 Final Iteration of Lighting Setup

1151 To ensure that both camera views have sufficient lighting and avoid shadows, the
1152 researchers decided to use a total of three LED lights. One is a small ring light placed
1153 exactly above the inspection tray. Another LED light is a stip light placed at the side of the
1154 inspection tray to improve lighting at the side of each bean. Lastly, another small LED light
1155 is placed under the inspection tray to ensure that the bottom camera has enough lighting.

Fig. 5.22 Top and Bottom View of the Cameras

5.8.3 System Operation

The system operation follows a sequential process to ensure the effective sorting of green coffee beans (GCBs) based on its classification and density. The automated system consists of two primary stages: 1st Stage which is the machine vision-based classification and 2nd stage which is the density-based sorting.

The process begins in the inputting of unsorted GCBs (Contains good and defective beans) into the screw feeder, which regulates the controlled and consistent delivery of the beans into the rotary conveyor table. The conveyor table is designed with aluminum guides to ensure a linearized formation of the beans to mitigate jamming. This also ensures a controlled movement of beans, ensuring that they drop onto the inspection tray one at a time. As the bean goes towards the edge of the conveyor table, the IR sensors detect the beans and stops the rotation to ensure the one-by-one inspection of the beans, this also prevents clogging, and jamming once the beans are dropped into the inspection tray.

The first phase involves machine-vision classification. Once the GCBs reach the inspection tray, each bean is analyzed one-by-one using a machine vision system consisting

De La Salle University

1171 of top and bottom cameras. The system captures high-resolution images of the bean and
1172 processes the data to determine which classification it belongs. If the bean is identified as
1173 defective, a signal is sent to the servo motor, which redirects the bean into the defective bin
1174 for disposal, if the bean is classified as good, it then proceeds to the second phase of the
1175 system

1176 The second stage involves density-based sorting, where each GCB's weight is measured
1177 using a precision scale, while its volume is determined by the ToF10120 infrared sensor.
1178 The system then calculates the density and classifies the bean accordingly.

1179 The sorting mechanism activates, directing beans into designated collection bins based
1180 on their density. High-density beans, often associated with specialty-grade quality, are
1181 separated from low-density, commercial-grade, or defective beans.

5.9 Prototype Testing

5.9.1 Sorting Speed

TABLE 5.2 SORTING SPEED TESTING TABLE

Test Condition	Conveyor Table Speed (RPM)	Inspection Tray Speed (RPM)	Sorting Speed (Beans per Minute)
100% Good Beans			
80% Good, 20% Defective Beans			
70% Good, 30% Defective Beans			
50% Good, 50% Defective Beans			
100% Defective Beans			

The sorting speed of the system will be determined by conducting at least five trials. Each trial will be exactly conducted for one minute. The number of beans sorted out within the time frame are considered as the sorting speed in beans per minute. Then, the average sorting speed from the five trials is computed. In each trial session, controlled variables such as motor speed of the inspection tray and rotating conveyor table are varied to observe the optimal setting for the system, ensuring that there are no beans jamming in the tray and fast enough to meet the minimum sorting speed. Table 6.6 shows the different conditions for each trial to ensure that the sorting speed across different type of beans are considered.

1192

5.9.2 Defect Sorting Accuracy

TABLE 5.3 GOOD BEAN CLASSIFICATION ACCURACY TESTING TABLE

Test Condition	Correctly Classified Beans	Misclassified Beans	Total Number of Beans
100% Good Beans			100
80% Good, 20% Defective Beans			100
70% Good, 30% Defective Beans			100
50% Good, 50% Defective Beans			100
100% Defective Beans			100

1193

The defect sorting accuracy by feeding 100 beans on each trial. For testing its accuracy for detecting good beans and defective beans, five trials are conducted containing 100 beans of good beans for the first trial, 80 good and 20 defects for the second trial, 50 good and 50 defects for the third trial, 20 good and 80 defects for the fourth trial, and 100 defects for the last trial. With these, the number of correctly classified and misclassified beans are logged into the system to compute for accuracy using the formula:

$$\text{Accuracy}(\%) = \left(\frac{\text{Correctly Classified Beans}}{\text{Total Beans Tested}} \right) \times 100 \quad (5.5)$$

TABLE 5.4 SPECIFIC DEFECT CLASSIFICATION ACCURACY TESTING TABLE

Test Condition	Correctly Classified Beans	Misclassified Beans	Total Number of Beans
100% Good Beans			100
80% Good, 20% Defective Beans			100
70% Good, 30% Defective Beans			100
50% Good, 50% Defective Beans			100
100% Defective Beans			100

1199 For further accuracy testing of the computer vision model in actual implementation, the
 1200 researchers also included testing trials for each defect type. Table 5.4 shows how each trial
 1201 is conducted. For example, the defect type chosen for the test is the Sour defect type. The
 1202 first trial contains 100 sour beans. For the second trial, 80 sour beans and 20 randomly
 1203 selected beans, excluding the chosen defect type which is sour. Thus, the random beans are
 1204 always the other classes except the chosen defect type to be tested. In this test, correctly
 1205 classified beans and misclassified beans are also considered to compute for the accuracy of
 1206 the system. By testing the system under different defect distributions, the robustness of the
 1207 machine vision model can be assessed.

TABLE 5.5 DATASET DISTRIBUTION FOR OVERALL TESTING

Bean Classification	Bean Count
Black	20
Broken	20
Dried Cherry	20
Floater	20
Fungus Damage	20
Good	20
Insect Damage	20
Sour	20
Total Beans	160

1208 Lastly, to assess the overall accuracy and reliability of the first stage, machine vision-
 1209 based defect classification, a trial consisting of a predefined dataset of 160 coffee beans
 1210 was conducted. Each category consists of 20 beans as shown in Table 5.5, including good
 1211 beans and the other defect types such as black, dried cherry, fungus, insect damage, sour,
 1212 floater, and broken beans.

1213 **5.9.3 Density Sorting Accuracy**

1214 To assess the accuracy of the mechanism, it will rely on measuring the accuracy and the
 1215 reliability of the density sorting mechanism in sorting out the dense beans to the less dense
 1216 beans. To successfully determine the accuracy of the system, the basis will be the scale,
 1217 where the system should be able to sort the dense beans to the less dense bean in relation
 1218 to the detected weight in the scale. A successful system should be able to sort with an
 1219 accuracy of 85

De La Salle University

1222 6.1 Description of the New Custom Dataset

TABLE 6.2 CLASS DISTRIBUTION SUMMARY

Class Name	Image Count
Black	205
Broken	203
Dried Cherry	206
Floater	202
Fungus Damage	207
Good	604
Insect Damage	201
Sour	202
Total	2030

1223 Table 6.2 presents the dataset's class distribution after adjustments. The image counts for
 1224 each category were increased such that the minimum is above 200, with "Good" exceeding
 1225 543; for instance, Black has 205 images and Good has 604 images. The table confirms a
 1226 total of 2,030 images distributed across the eight classes, ensuring a balanced dataset that
 1227 maintains diversity while meeting the minimum requirements.

TABLE 6.3 DATASET SPLIT SUMMARY

Split	Percentage	Image Count	Augmentation
Train	70%	1421	Original training images are augmented three times
Validation	20%	406	Non-augmented
Test	10%	203	Non-augmented

1228 Table 6.3 outlines the dataset split into training, validation, and test sets. The training
 1229 set comprises 70% (1,421 images), while the validation and test sets account for 20% (406

1230 images) and 10% (203 images) respectively, with the training images later augmented 3×
1231 per image.

1232 **6.2 Performance of Classification Models on Cus- 1233 tom Dataset**

1234 Four different classification models, such as EfficientNet, YOLOv8, YOLOv11 and
1235 YOLOv12, were benchmarked to determine the most optimal model to be used for the sys-
1236 tem. Each model was trained using a custom dataset manually gathered by the researchers.
1237 In addition, augmentations such as rotation, flip, blur and noise, were applied.

1238

6.2.1 EfficientNetV2S

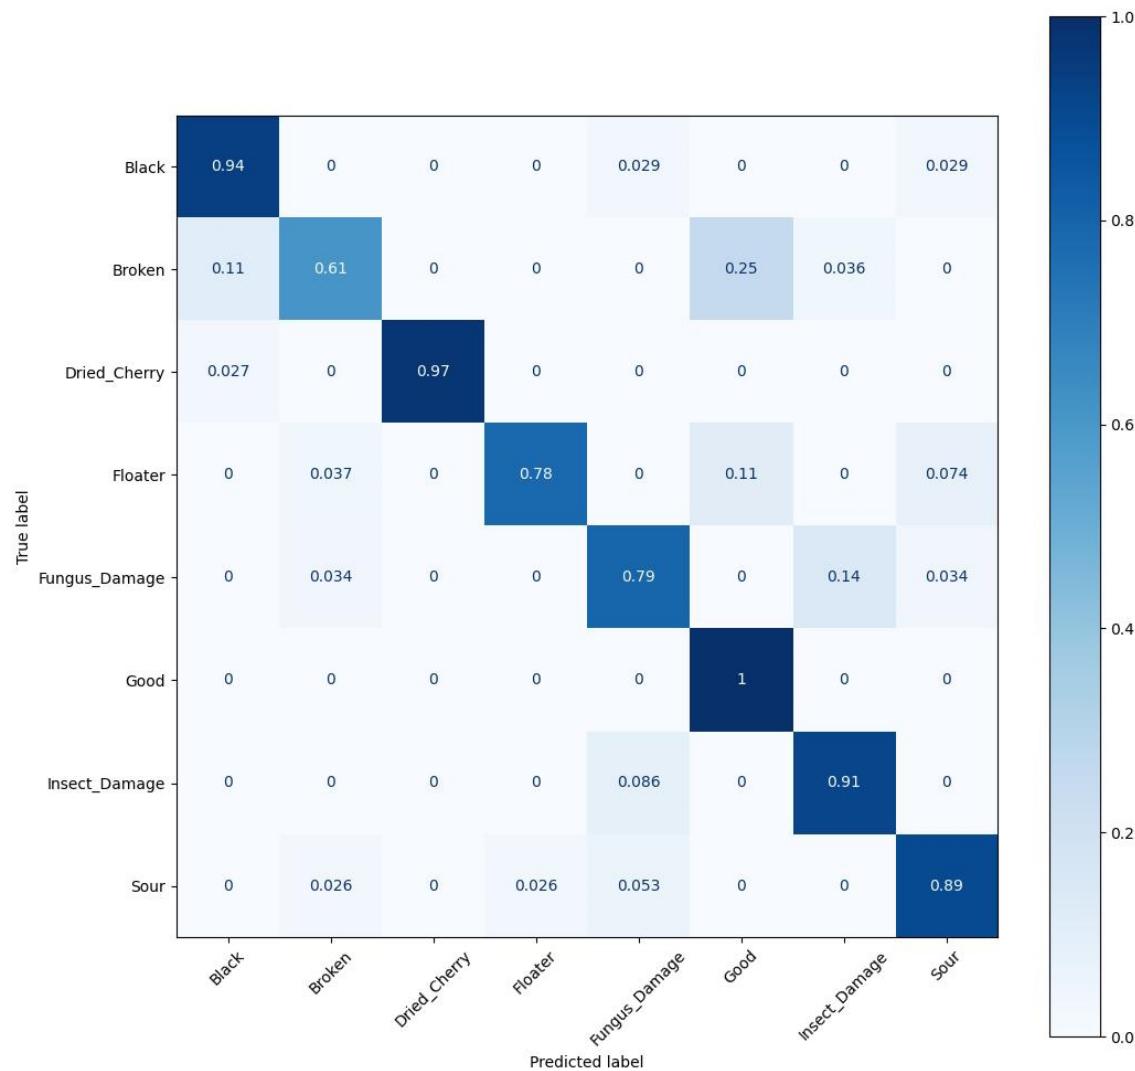

Fig. 6.1 Normalized Confusion Matrix for EfficientNetV2S on Test Dataset

1239

The confusion matrix depicted in Figure 6.1 shows how the EfficientNetV2 classification

1240

model performed against the validation dataset, where normalized values are used to

1241

represent percentage predictions by each class. The matrix is seen to indicate that even

De La Salle University

1242 though EfficientNet was able to classify the Good bean class perfectly (1.00) and accurately
1243 for classes like Dried Cherry (0.97) and Black (0.94), its classification was poor for many
1244 defect classes. In particular, the model exhibited significant misclassification in the Broken
1245 bean class, with just 61% correctly classified, while a significant 25% were misclassified as
1246 Good. Likewise, for Floater and Fungus Damage, EfficientNetV2 had true positive rates
1247 of only 0.78 and 0.79, respectively, with some floaters being mistaken as Fungus Damage
1248 (11%) and Sour (7.4%). This trend indicates that EfficientNet found it difficult to identify
1249 subtle visual variations between defect types, particularly when texture or color change
1250 overlapped among classes.

1251

6.2.2 YOLOv8

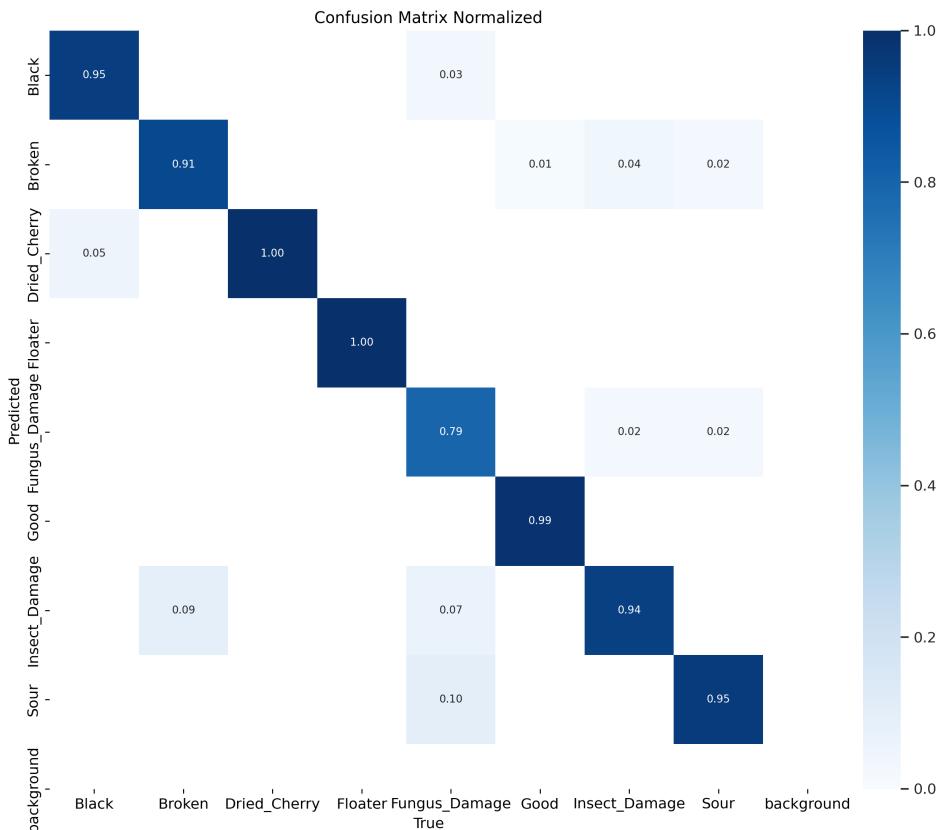

Fig. 6.2 Normalized Confusion Matrix for YOLOv8 on Test Dataset

1252

The YOLOv8 confusion matrix shows excellent classification accuracy in the majority of defect classes, with exceptionally good performance in separating Dried Cherry, Floater, and Good beans, each of which had a perfect or near-perfect true positive rate (TPr) of 1.00, 1.00, and 0.99, respectively. The model also correctly classified Black beans at 0.95, reflecting excellent robustness in detecting strongly distinguishable visual features. However, there was some confusion between visually similar classes, like Fungus Damage, which had a true positive rate of 0.79. Misclassifications for the category were distributed between

1259 Insect Damage and Sour beans, at 2% each, which would suggest some overlap in texture
1260 or color patterns that the model found difficulty in distinguishing. However, there was a
1261 lesser, but still significant confusion between Sour and Fungus Damage, where Sour beans
1262 were misclassified at 0.10 within other classes. The Insect Damage class performed well at
1263 0.94, though there was some confusion (6%) with Fungus Damage. Broken beans reached
1264 0.91, with small misclassifications into Dried Cherry and others. Most importantly, there
1265 was no confusion with the Background class, indicating YOLOv8's excellent capability
1266 of isolating and detecting bean contours well. In general, YOLOv8 provides balanced
1267 performance, with satisfactory overall accuracy across different classes.

1268

6.2.3 YOLOv11-cls

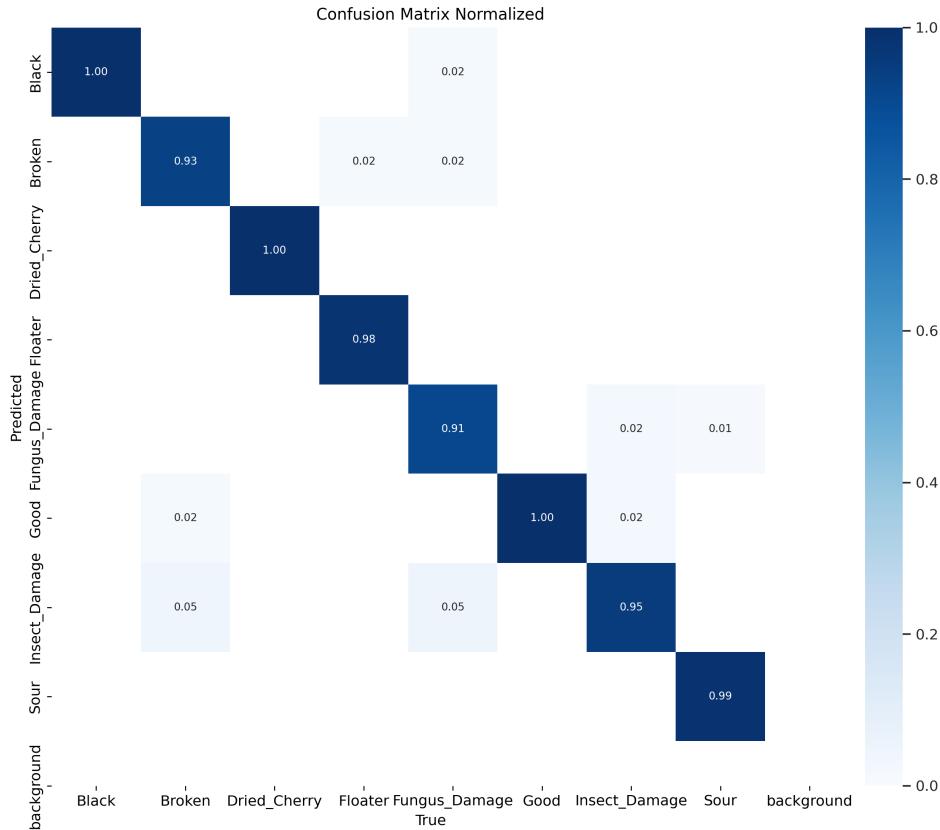

Fig. 6.3 Normalized Confusion Matrix for YOLOv11 on Test Dataset

1269

The YOLOv11 confusion matrix shows significant gains in classification consistency, especially in visually different categories. The model obtained ideal classification (1.00) for both Good beans and Floater, which means a high capability to identify well-defined, good beans and floating defects. Likewise, excellent true positive rates were achieved for Black (0.97), Dried Cherry (0.97), and Broken (0.94) beans with limited confusion (at most 3%) with adjacent defect classes, showing the robustness of YOLOv11 in detecting salient visual features. More complex defects, YOLOv11 achieved a true positive of 0.90 for Fungus

1270

1271

1272

1273

1274

1275

1276 Damage, though misclassification did occur into Sour beans (7%) and Insect Damage (2%),
1277 which points to some confusion between defects that have comparable texture degradation.
1278 The Insect Damage class achieved a strong 0.92, but was at times confused with Black
1279 and Fungus Damage, both by 3%. The performance of the model slightly declined in the
1280 Sour bean class, which exhibited the lowest true positive rate of 0.89, with significant
1281 misclassifications to Fungus Damage (7%), indicative of visual discoloration or wrinkling
1282 overlap. In general, YOLOv11 shows a good balance in performance, being excellent in
1283 clean categories and keeping stable results for complicated defect types. Its high precision
1284 with low false positives on most classes indicate its potential in real-time defect detection
1285 applications, with room for improvement through additional dataset augmentation for
1286 biologically deteriorated beans.

1287

6.2.4 YOLOv12-cls

Fig. 6.4 Normalized Confusion Matrix for YOLOv12 on Test Dataset

1288

The YOLOv12 performance, as reflected in the normalized confusion matrix, presents good classification performance for most defect classes. Most importantly, Sour beans and Good beans were classified with a true positive rate of 0.99, and Dried Cherry and Black beans followed closely with 0.99 and 0.96, respectively. This implies excellent sensitivity of the model to clearly distinguishable visual features, particularly those with color homogeneity and texture contrast. However, some defect types caused classification difficulties. Broken beans had the worst classification accuracy of 0.80, with high misclassifications spread

1295 over other classes like Dried Cherry, Floater, and Insect Damage, each contributing 1–2%
 1296 to the confusion. Likewise, Fungus Damage was classified correctly 88% of the time, but
 1297 exhibited confusion primarily with Insect Damage (5%) and Good beans (2%), meaning
 1298 overlap of surface stain or odd texture. The Floater class was highly accurate at 0.97 and
 1299 had little confusion. Insect Damage, despite maintaining a consistency of 0.92, had some
 1300 misclassifications as Fungus Damage (10%). Overall, YOLOv12 is a well-balanced and
 1301 high-performing model, with leading accuracy in classes that have clear visual differences
 1302 and moderate misclassification in Fungus and Insect-damaged beans, which are still visually
 1303 complex. The performance of the model shows an enhanced capability to generalize
 1304 between defect types.

1305 6.3 Actual Performance of Trained Models in the 1306 System

TABLE 6.4 SPECIFIC PERFORMANCE OF THE MODELS FOR EACH DEFECT

1307

1308

Table 6.4 shows the detailed classification performance of four deep learning models, namely EfficientNetV2, YOLOv8, YOLOv11, and YOLOv12, trained on eight defect classes in green coffee beans. Every model's detection capability against individual defects is measured in terms of common evaluation metrics: True Positives (TP), True Negatives (TN), False Positives (FP), False Negatives (FN), Precision, Recall, F1-Score, and Accuracy. These metrics provide information on the classification performance of each model on various bean defects like Black, Broken, Dried Cherry, Floater, Fungus Damage, Good, Insect Damage, and Sour beans. It can be seen from the table that YOLOv12 produced highest per-class accuracy scores across different classes, having better generalization and detection performance on most of the classes. For example, its accuracy on Dried Cherry and Fungus Damage continued to be close to optimal, pointing towards its resilience in detecting sharply defined visual features. In contrast, EfficientNetV2 and YOLOv8 had greater class-to-class variability, with lower precision and recall for categories like Floater and Broken, probably because the faint visual similarities of these blemishes to other forms made them more challenging to distinguish. This chart emphasizes the level of detail per

1322

1323 model, where YOLO-based models in general perform better than EfficientNetV2 when
 1324 it comes to precision and recall, particularly on real-time classification tasks. There are
 1325 still trade-offs in terms of performance noticed in defect types with shared visual features,
 1326 showing that more comprehensive image preprocessing or feature enhancement may be
 1327 needed for future versions.

TABLE 6.5 MODEL PERFORMANCE COMPARISON

Model	Precision (%)	Recall (%)	F1-Score (%)	Accuracy (%)
EfficientNetV2	70.86	75.00	72.86	81.20
YOLOv8	75.64	80.00	77.71	85.60
YOLOv11	84.36	85.00	84.64	88.80
YOLOv12	94.00	90.00	91.91	90.00

1328 Table 6.5 summarizes the overall performance of each classification model by presenting
 1329 average Precision, Recall, F1-Score, and Accuracy for all defect types. This general
 1330 overview enables comparison of each model's overall performance regardless of particular
 1331 defect classes. We can see that YOLOv12 performs the best among all the models with the
 1332 best average accuracy of 90.0%, and well-balanced precision and recall. This confirms its
 1333 good detection consistency and minimal false positives across the trials during the actual
 1334 testing. YOLOv11 and YOLOv8 are close second and third, with average accuracies of
 1335 88.8% and 85.6%, respectively, showing consistent performance but with slightly higher
 1336 misclassification rates. EfficientNetV2, although effective in detecting significant defects,
 1337 had the poorest performance at 81.2% accuracy.

6.4 Sorting Speed

TABLE 6.6 SORTING SPEED TEST CONDITIONS

Test Condition	Conveyor (RPM)	Inspection (RPM)	Sorting (Beans/min)
100% Good Beans	175	343	22
80% Good, 20% Defective	175	343	22
70% Good, 30% Defective	175	343	21
50% Good, 50% Defective	175	343	24
100% Defective Beans	175	343	22

1339 Table 6.6 presents the prototype system's sorting speed performance under different
 1340 test conditions. The conveyor table speed and inspection tray motor speed is constant at
 1341 175 RPM and 343 RPM, respectively, to ensure consistency in all trials. The sorting speed,
 1342 expressed in beans per minute, indicates the system's capacity to recognize and process
 1343 coffee beans. The outcomes indicate that the system maintained a steady average sorting
 1344 rate of 22 beans per minute in most conditions, such as 100

1345 **Chapter 7**

1346 **CONCLUSIONS, RECOMMENDATIONS, AND**
1347 **FUTURE DIRECTIVES**

1348 7.1 Concluding Remarks

1349 The study was able to present the design, development, and actual implementation of a two-
1350 staged automated green coffee bean sorting system, utilizing computer vision and embedded
1351 systems. The design is composed of a rotating conveyor table, a dual-camera inspection
1352 tray, defect sorting mechanism, and density-based sorting mechanism. In addition, four
1353 deep learning-based classification models such as EfficientNetV2, YOLOv8, YOLOv11,
1354 and YOLOv12 were benchmarked. These models were deployed and tested into the actual
1355 defect sorting system with a test dataset of 20 beans per classification, where the YOLOv12
1356 achieved the highest accuracy of 90.0%. In terms of the sorting speed, the system was
1357 tested in 5 trials, where it achieved an average sorting speed of 22.2 beans per minute. The
1358 system was tested under varying quality distributions and maintained consistent sorting
1359 speeds, thereby confirming its practical viability. Overall, the results indicate that the
1360 integration of deep learning and embedded automation offers a robust and scalable solution
1361 for post-harvest coffee bean quality assessment.

1362 7.2 Contributions

1363 This study contributed to the coffee industry in the Philippines by introducing a two-
1364 stage automated coffee bean sorter that enhances coffee quality assessment by segregating
1365 defective beans and sorting dense and less-dense beans. This system integrates machine
1366 vision and density-based sorting, ensuring that high-quality, dense beans and potential
1367 specialty-grade coffee are selected for further processing. This system can support the
1368 Philippine coffee industry's efforts to enhance product quality and meet global specialty
1369 coffee standards to improve market competitiveness.

1370 **7.3 Recommendations**

1371 The following are the recommendations for further study of this design:

- 1372 • Optimize the density-based sorting mechanism
- 1373 • Improvement of system portability by reducing the overall size and weight of the
- 1374 system

1375 **7.4 Future Prospects**

1376 This study offers a building block for future innovation in intelligent post-harvest coffee
1377 processing. A potential extension is combining cloud-based data storage and analytics for
1378 traceability at the batch level and remote monitoring. Another would be the deployment of
1379 light inference models on microcontroller units (MCUs) to facilitate real-time, on-device
1380 computation, thus minimizing system latency and increasing portability. Additional re-
1381 search might also investigate the use of unsupervised or semi-supervised learning methods
1382 to identify new or infrequent defects without depending solely on labeled data. Commer-
1383 cially, the system can be scaled to process greater volumes using modular conveyor lines
1384 and parallel sorting stations. These developments would greatly benefit coffee producers
1385 by providing consistent, efficient, and objective bean quality assessment.

Appendix E USAGE EXAMPLES

1550

1551 The user is expected to have a working knowledge of L^AT_EX. A good introduction is
 1552 in [?]. Its latest version can be accessed at <http://www.ctan.org/tex-archive/info/lshort>.

E1 Equations

1554 The following examples show how to typeset equations in L^AT_EX. This section also shows
 1555 examples of the use of `\gls{ }` commands in conjunction with the items that are in
 1556 the `notation.tex` file. **Please make sure that the entries in `notation.tex` are**
 1557 **those that are referenced in the L^AT_EX document files used by this Thesis. Please**
 1558 **comment out unused notations and be careful with the commas and brackets in**
 1559 **`notation.tex` .**

1560 In (E.1), the output signal $y(t)$ is the result of the convolution of the input signal $x(t)$
 1561 and the impulse response $h(t)$.

$$y(t) = h(t) * x(t) = \int_{-\infty}^{+\infty} h(t - \tau) x(\tau) d\tau \quad (\text{E.1})$$

1562 Other example equations are as follows.

$$\begin{bmatrix} V_1 \\ I_1 \end{bmatrix} = \begin{bmatrix} A & B \\ C & D \end{bmatrix} \begin{bmatrix} V_2 \\ I_2 \end{bmatrix} \quad (\text{E.2})$$

$$\frac{1}{2} < \left\lfloor \mod \left(\left\lfloor \frac{y}{17} \right\rfloor 2^{-17|x| - \mod(\lfloor y \rfloor, 17)}, 2 \right) \right\rfloor, \quad (\text{E.3})$$

$$|\zeta(x)^3 \zeta(x+iy)^4 \zeta(x+2iy)| = \exp \sum_{n,p} \frac{3 + 4 \cos(ny \log p) + \cos(2ny \log p)}{np^{nx}} \geq 1 \quad (\text{E.4})$$

1563

The verbatim L^AT_EX code of Sec. E1 is in List. E.1.

Listing E.1: Sample L^AT_EX code for equations and notations usage

```

1 The following examples show how to typeset equations in \LaTeX. This
2 section also shows examples of the use of \verb| \gls{ } | commands
3 in conjunction with the items that are in the \verb| notation.tex |
4 file. \textbf{Please make sure that the entries in} \verb| notation.tex |
5 \textbf{| are those that are referenced in the \LaTeX \
6 document files used by this \documentType. Please comment out
7 unused notations and be careful with the commas and brackets in} \verb|
8 \verb| notation.tex |.
9
10 In \eqref{eq:conv}, the output signal \gls{not:output_sigt} is the
11 result of the convolution of the input signal \gls{not:input_sigt}
12 and the impulse response \gls{not:ir}.
13
14 \begin{eqnarray}
15     y\left( t \right) = h\left( t \right) * x\left( t \right)=\int_{-\infty}^{+\infty}h\left( t-\tau \right)x\left( \tau \right) \mathrm{d}\tau
16
17 \label{eq:conv}
18 \end{eqnarray}
19 Other example equations are as follows.
20
21 \begin{eqnarray}
22     \left[ \frac{V_1}{I_1} \right] = \begin{bmatrix} A & B \\ C & D \end{bmatrix}
23
24 \label{eq:ABCD}
25 \end{eqnarray}
26
27 \begin{eqnarray}
28 \frac{1}{2} < \left\lfloor \mod{\left\lfloor \frac{y}{17} \right\rfloor}{2^17} \right\rfloor - \left\lfloor \mod{\left\lfloor \frac{y}{17} \right\rfloor}{2} \right\rfloor,
29 \end{eqnarray}
30
31 \begin{eqnarray}
32 \left| \zeta(x)^3 \zeta(x + iy)^4 \zeta(x + 2iy) \right| = \exp \sum_{n,p} \frac{3 + 4 \cos(ny \log p) + \cos(2ny \log p)}{np^{nx}}
33 \geq 1
34 \end{eqnarray}

```

1564

E2 Notations

1565

In order to use the standardized notation, the user is highly suggested to see the ISO 80000-2 standard [?].

1566

See https://en.wikipedia.org/wiki/Help:Displaying_a_formula and https://en.wikipedia.org/wiki/List_of_mathematical_symbols for L^AT_EX maths and other notations, respectively.

1567

The following were taken from `isomath-test.tex`.

1568

E2.1 Math alphabets

1569

If there are other symbols in place of Greek letters in a math alphabet, it uses T1 or OT1 font encoding instead of OML.

1570

mathnormal	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, 0, 1, 9$
mathit	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$
mathrm	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$
mathbf	$\mathbf{A}, \mathbf{B}, \mathbf{\Gamma}, \mathbf{\Delta}, \mathbf{\Theta}, \mathbf{\Lambda}, \mathbf{\Xi}, \mathbf{\Pi}, \mathbf{\Sigma}, \mathbf{\Phi}, \mathbf{\Psi}, \mathbf{\Omega}, ff, fi, \mathbf{\beta}, ^!, \mathbf{v}, \mathbf{w}, 0, 1, 9$
mathsf	$\mathsf{A}, \mathsf{B}, \mathsf{\Gamma}, \mathsf{\Delta}, \mathsf{\Theta}, \mathsf{\Lambda}, \mathsf{\Xi}, \mathsf{\Pi}, \mathsf{\Sigma}, \mathsf{\Phi}, \mathsf{\Psi}, \mathsf{\Omega}, ff, fi, \mathsf{\beta}, ^!, \mathsf{v}, \mathsf{w}, 0, 1, 9$
mathtt	$\mathtt{A}, \mathtt{B}, \mathtt{\Gamma}, \mathtt{\Delta}, \mathtt{\Theta}, \mathtt{\Lambda}, \mathtt{\Xi}, \mathtt{\Pi}, \mathtt{\Sigma}, \mathtt{\Phi}, \mathtt{\Psi}, \mathtt{\Omega}, \mathtt{\beta}, \mathtt{\pi}, \mathtt{\nu}, \mathtt{\omega}, \mathtt{v}, \mathtt{w}, 0, 1, 9$

1571

New alphabets bold-italic, sans-serif-italic, and sans-serif-bold-italic.

1572

mathbfit	$\mathbf{A}, \mathbf{B}, \mathbf{\Gamma}, \mathbf{\Delta}, \mathbf{\Theta}, \mathbf{\Lambda}, \mathbf{\Xi}, \mathbf{\Pi}, \mathbf{\Sigma}, \mathbf{\Phi}, \mathbf{\Psi}, \mathbf{\Omega}, \mathbf{\alpha}, \mathbf{\beta}, \mathbf{\pi}, \mathbf{\nu}, \mathbf{\omega}, \mathbf{v}, \mathbf{w}, \mathbf{o}, \mathbf{1}, \mathbf{9}$
mathsfit	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, o, 1, 9$
mathsfbf	$\mathsf{A}, \mathsf{B}, \mathsf{\Gamma}, \mathsf{\Delta}, \mathsf{\Theta}, \mathsf{\Lambda}, \mathsf{\Xi}, \mathsf{\Pi}, \mathsf{\Sigma}, \mathsf{\Phi}, \mathsf{\Psi}, \mathsf{\Omega}, \mathsf{\alpha}, \mathsf{\beta}, \mathsf{\pi}, \mathsf{\nu}, \mathsf{\omega}, \mathsf{v}, \mathsf{w}, \mathsf{o}, \mathsf{1}, \mathsf{9}$

1573

Do the math alphabets match?

1574

$ax\alpha\omega ax\alpha\omega ax\alpha\omega \quad TC\Theta\Gamma TC\Theta\Gamma TC\Theta\Gamma$

1575

E2.2 Vector symbols

1576

Alphabetic symbols for vectors are boldface italic, $\lambda = e_1 \cdot a$, while numeric ones (e.g. the zero vector) are bold upright, $a + 0 = a$.

1577

E2.3 Matrix symbols

1578

Symbols for matrices are boldface italic, too:¹ $\Lambda = E \cdot A$.

¹However, matrix symbols are usually capital letters whereas vectors are small ones. Exceptions are physical quantities like the force vector F or the electrical field E .

1581 **E2.4 Tensor symbols**

1582 Symbols for tensors are sans-serif bold italic,

$$\boldsymbol{\alpha} = \mathbf{e} \cdot \mathbf{a} \iff \alpha_{ijl} = e_{ijk} \cdot a_{kl}.$$

1583 The permittivity tensor describes the coupling of electric field and displacement:

$$\mathbf{D} = \epsilon_0 \epsilon_r \mathbf{E}$$

	E2.5 Bold math version												
1584													
1585	The “bold” math version is selected with the commands <code>\boldmath</code> or <code>\mathversion{bold}</code>												
	<table> <tr> <td>mathnormal</td><td>$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, 0, 1, 9$</td></tr> <tr> <td>mathit</td><td>$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$</td></tr> <tr> <td>mathrm</td><td>$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$</td></tr> <tr> <td>mathbf</td><td>$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$</td></tr> <tr> <td>mathsf</td><td>$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$</td></tr> <tr> <td>mathtt</td><td>$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$</td></tr> </table>	mathnormal	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, 0, 1, 9$	mathit	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$	mathrm	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$	mathbf	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$	mathsf	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$	mathtt	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$

1732 131 Symbols for matrices are boldface italic, too:%
1733 132 \footnote{However, matrix symbols are usually capital letters whereas
1734 133 vectors
1735 134 are small ones. Exceptions are physical quantities like the force
1736 135 vector $ \vec{F} $ or the electrical field $ \vec{E} $.%}
1737 136 $ \mathbf{matrixsym}{\Lambda} = \mathbf{matrixsym}{E} \cdot \mathbf{matrixsym}{A} . $%
1738 137
1739 138
1740 139 \subsection{Tensor symbols}
1741 140
1742 141 Symbols for tensors are sans-serif bold italic,
1743 142
1744 143 \[
1745 144 \mathbf{tensorsym}{\alpha} = \mathbf{tensorsym}{e} \cdot \mathbf{tensorsym}{a}
1746 145 \quad \Longleftarrow \quad
1747 146 \alpha_{ijl} = e_{ijk} \cdot a_{kl}.
1748 147 \]
1749 148
1750 149 The permittivity tensor describes the coupling of electric field and
1751 150 displacement: \[
1752 151 \vec{D} = \epsilon_0 \mathbf{tensorsym}{\epsilon}(\mathbf{r}) \vec{E} \]
1753 152 \]
1754 153

```

E3 Abbreviation

This section shows examples of the use of L^AT_EX commands in conjunction with the items that are in the `abbreviation.tex` and in the `glossary.tex` files. Please see List. E.3. **To lessen the L^AT_EX parsing time, it is suggested that you use `\acr{}` only for the first occurrence of the word to be abbreviated.**

Again please see List. E.3. Here is an example of first use: alternating current (ac). Next use: ac. Full: alternating current (ac). Here's an acronym referenced using `\acr`: hyper-text markup language (html). And here it is again: html. If you are used to the `glossaries` package, note the difference in using `\gls`: hyper-text markup language (html). And again (no difference): hyper-text markup language (html). For plural use `\glsp{}`. Here are some more entries:

- extensible markup language (xml) and cascading style sheet (css).
- Next use: xml and css.
- Full form: extensible markup language (xml) and cascading style sheet (css).
- Reset again.
- Start with a capital. Hyper-text markup language (html).
- Next: Html. Full: Hyper-text markup language (html).
- Prefer capitals? Extensible markup language (XML). Next: XML. Full: extensible markup language (XML).
- Prefer small-caps? Cascading style sheet (css). Next: CSS. Full: cascading style sheet (CSS).
- Resetting all acronyms.
- Here are the acronyms again:
- Hyper-text markup language (HTML), extensible markup language (XML) and cascading style sheet (CSS).
- Next use: HTML, XML and CSS.
- Full form: Hyper-text markup language (HTML), extensible markup language (XML) and cascading style sheet (CSS).

- 1785 • Provide your own link text: style sheet.

1786 The verbatim L^AT_EX code of Sec. E3 is in List. E.3.

Listing E.3: Sample L^AT_EX code for abbreviations usage

```

1 Again please see List.~\ref{lst:abbrv}. Here is an example of first use:
  \acr{ac}. Next use: \acr{ac}. Full: \gls{ac}. Here's an acronym
  referenced using \verb|\acr|: \acr{html}. And here it is again: \acr{html}.
  If you are used to the \texttt{glossaries} package, note
  the difference in using \verb|\gls|: \gls{html}. And again (no
  difference): \gls{html}. Here are some more entries:
2
3 \begin{itemize}
4
5   \item \acr{xml} and \acr{css}.
6
7   \item Next use: \acr{xml} and \acr{css}.
8
9   \item Full form: \gls{xml} and \gls{css}.
10
11  \item Reset again. \glsresetall{abbreviation}
12
13  \item Start with a capital. \Acr{html}.
14
15  \item Next: \Acr{html}. Full: \Gls{html}.
16
17  \item Prefer capitals? \renewcommand{\acronymfont}[1]{\
      \MakeTextUppercase{#1}} \Acr{xml}. Next: \acr{xml}. Full: \gls{xml}
      }.
18
19  \item Prefer small-caps? \renewcommand{\acronymfont}[1]{\textsc{#1}} \
      \Acr{css}. Next: \acr{css}. Full: \gls{css}.
20
21  \item Resetting all acronyms.\glsresetall{abbreviation}
22
23  \item Here are the acronyms again:
24
25  \item \Acr{html}, \acr{xml} and \acr{css}.
26
27  \item Next use: \Acr{html}, \acr{xml} and \acr{css}.
28
29  \item Full form: \Gls{html}, \gls{xml} and \gls{css}.
30
31  \item Provide your own link text: \glslink{[textbf]css}{style}
32
33 \end{itemize}
```

1787 E4 Glossary

1788 This section shows examples of the use of `\gls{ }` commands in conjunction with the
 1789 items that are in the `glossary.tex` and `notation.tex` files. Note that entries in
 1790 `notation.tex` are prefixed with “`not:`” label (see List. E.4).

1791 **Please make sure that the entries in `notation.tex` are those that are referenced
 1792 in the L^AT_EX document files used by this Thesis. Please comment out unused notations
 1793 and be careful with the commas and brackets in `notation.tex`.**

- 1794 • Matrices are usually denoted by a bold capital letter, such as \mathbf{A} . The matrix’s (i, j) th
 1795 element is usually denoted a_{ij} . Matrix \mathbf{I} is the identity matrix.
- 1796 • A set, denoted as \mathcal{S} , is a collection of objects.
- 1797 • The universal set, denoted as \mathcal{U} , is the set of everything.
- 1798 • The empty set, denoted as \emptyset , contains no elements.
- 1799 • Functional Analysis is seen as the study of complete normed vector spaces, i.e.,
 1800 Banach spaces.
- 1801 • The cardinality of a set, denoted as $|\mathcal{S}|$, is the number of elements in the set.

1802 The verbatim L^AT_EX code for the part of Sec. E4 is in List. E.4.

Listing E.4: Sample L^AT_EX code for glossary and notations usage

```

1 \begin{itemize}
2
3   \item \Glspl{matrix} are usually denoted by a bold capital letter,
4       such as $\mathbf{A}$. The \gls{matrix}'s $(i,j)$th element is
5       usually denoted $a_{ij}$. \Gls{matrix} $\mathbf{I}$ is the
6       identity \gls{matrix}.
7
8   \item A set, denoted as \gls{not:set}, is a collection of objects.
9
10  \item The universal set, denoted as \gls{not:universalSet}, is the
11      set of everything.
12
13  \item The empty set, denoted as \gls{not:emptySet}, contains no
14      elements.
15
16  \item \Gls{Functional Analysis} is seen as the study of complete
17      normed vector spaces, i.e., Banach spaces.
18
19  \item The cardinality of a set, denoted as \gls{not:cardinality}, is
20      the number of elements in the set.
21
22 \end{itemize}

E7 Algorithm or Pseudocode Listing

Table E.2 shows an example pseudocode. Note that if the pseudocode exceeds one page, it can mean that its implementation is not modular. List. E.9 shows the corresponding L^AT_EX code.

TABLE E.2 CALCULATION OF $y = x^n$

Input(s):	
n	: n th power; $n \in \mathbb{Z}^+$
x	: base value; $x \in \mathbb{R}^+$
Output(s):	
y	: result; $y \in \mathbb{R}^+$

Require: $n \geq 0 \vee x \neq 0$

Ensure: $y = x^n$

```

1:  $y \Leftarrow 1$ 
2: if  $n < 0$  then
3:    $X \Leftarrow 1/x$ 
4:    $N \Leftarrow -n$ 
5: else
6:    $X \Leftarrow x$ 
7:    $N \Leftarrow n$ 
8: end if
9: while  $N \neq 0$  do
10:  if  $N$  is even then
11:     $X \Leftarrow X \times X$ 
12:     $N \Leftarrow N/2$ 
13:  else { $N$  is odd}
14:     $y \Leftarrow y \times X$ 
15:     $N \Leftarrow N - 1$ 
16:  end if
17: end while

```

Listing E.9: Sample L^AT_EX code for algorithm or pseudocode listing usage

```

E8 Program/Code Listing

1927
1928

List. E.10 is a program listing of a C code for computing Fibonacci numbers by calling the actual code. Please see the `code` subdirectory.

Listing E.10: Computing Fibonacci numbers in C (`./code/fibo.c`)

```

1  /* fibo.c -- It prints out the first N Fibonacci
2   * numbers.
3   */
4
5 #include <stdio.h>
6
7 int main(void) {
8     int n;          /* Number of fibonacci numbers we will print */
9     int i;          /* Index of fibonacci number to be printed next */
10    int current;   /* Value of the (i)th fibonacci number */
11    int next;      /* Value of the (i+1)th fibonacci number */
12    int twoaway;   /* Value of the (i+2)th fibonacci number */
13
14    printf("How many Fibonacci numbers do you want to compute? ");
15    scanf("%d", &n);
16    if (n<=0)
17        printf("The number should be positive.\n");
18    else {
19        printf("\n\n\tI\tFibonacci(I)\n\t=====\\n");
20        next = current = 1;
21        for (i=1; i<=n; i++) {
22            printf("\t%d\t%d\\n", i, current);
23            twoaway = current+next;
24            current = next;
25            next = twoaway;
26        }
27    }
28}
29
30 /* The output from a run of this program was:
31
32 How many Fibonacci numbers do you want to compute? 9
33
34 I  Fibonacci(I)
35 =====

1969 E10 Citing

1970 Citing bibliography content is done using BibTeX. It requires the creation of a BibTeX
 1971 file (.bib extension name), and then added in the argument of \bibliography{ } . For
 1972 each .bib file, separate them by a comma in the argument of \bibliography{ } without
 1973 the extension name. Building your BibTeX file (references.bib) can be done easily with a
 1974 tool called JabRef (www.jabref.org).

2134 E11 Index

2135 For key words or topics that are expected (or the user would like) to appear in the Index, use
 2136 `\index{key}`, where `key` is an example keyword to appear in the Index. For example,
 2137 Fredholm integral and Fourier operator of the following paragraph are in the Index.

2138 If we make a very large matrix with complex exponentials in the rows (i.e., cosine real
 2139 parts and sine imaginary parts), and increase the resolution without bound, we approach
 2140 the kernel of the Fredholm integral equation of the 2nd kind, namely the Fourier operator
 2141 that defines the continuous Fourier transform.

2142 List. E.15 is a program listing of the above-mentioned paragraph.

Listing E.15: Sample L^AT_EX code for Index usage

```
1 If we make a very large matrix with complex exponentials in the rows (i.  

   e., cosine real parts and sine imaginary parts), and increase the  

   resolution without bound, we approach the kernel of the \index{  

   Fredholm integral} Fredholm integral equation of the 2nd kind,  

   namely the \index{Fourier} Fourier operator that defines the  

   continuous Fourier transform.
```

2143

E12 Adding Relevant PDF Pages

2144

Examples of such PDF pages are Standards, Datasheets, Specification Sheets, Application Notes, etc. Selected PDF pages can be added (see List. E.16), but note that the options must be tweaked. See the manual of `pdfpages` for other options.

2145

2146

Listing E.16: Sample L^AT_EX code for including PDF pages

```
1 \includepdf[pages={8-10},%
2 offset=3.5mm -10mm,%
3 scale=0.73,%
4 frame,%
5 pagecommand={},]
6 {./reference/Xilinx2015-UltraScale-Architecture-Overview.pdf}
```

Notes:

1. Go to [Ordering Information](#) for package designation details.
2. All packages have 1.0mm ball pitch.
3. Packages with the same last letter and number sequence, e.g., A2104, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined. See the [UltraScale Architecture Product Selection Guide](#) for details on inter-family migration.

John Carlo Theo S. Dela Cruz received the B.Sc., M.Sc., and Ph.D. degrees in chemistry all from the Pamantasan ng Pilipinas, San Juan, Metro Manila, Philippines, in 2020, 2022 and 2025 respectively. He is currently taking up his B.Sc. Computer Engineering studies. He has developed several high-speed packet-switched network systems and node modules. His research interests include high-speed packet-switched networks, high speed radio interface design, discrete simulation and statistical models for packet switches.

Pierre Justine P. Parel received the B.Sc., M.Sc., and Ph.D. degrees in chemistry all from the Pamantasan ng Pilipinas, San Juan, Metro Manila, Philippines, in 2020, 2022 and 2025 respectively. He is currently taking up his B.Sc. Computer Engineering studies. He has developed several high-speed packet-switched network systems and node modules. His research interests include high-speed packet-switched networks, high speed radio interface design, discrete simulation and statistical models for packet switches.

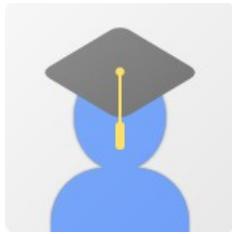

Jiro Renzo D. Tabiolo received the B.Sc., M.Sc., and Ph.D. degrees in chemistry all from the Pamantasan ng Pilipinas, San Juan, Metro Manila, Philippines, in 2020, 2022 and 2025 respectively. He is currently taking up his B.Sc. Computer Engineering studies. He has developed several high-speed packet-switched network systems
