ABSTRACT

39 With the growing demand for coffee, the Philippine coffee industry faces the challenge of
40 inefficient and utilizing traditional manual sorting methods which hinders quality consistency
41 and competitiveness. This study proposes to develop a two-stage automated green
42 coffee bean (GCB) sorter designed to identify and segregate defective beans from the batch,
43 and the good classification would proceed to the second stage which is the density-analysis
44 stage wherein it sorts the dense and less-dense beans. The system integrates machine vision
45 that utilizes the RF-DETR model for detection and uses YOLOv12 and Vision Transformer
46 (ViT) models for classification. YOLOv12 achieved an average accuracy of 94.8% across
47 all trials with varying test conditions, while the ViT model achieved an accuracy of 98%,
48 which was similar to its per-classification accuracy. Overall, the ViT model was superior
49 across all metrics in both training and testing phases. The density-analysis stage achieved
50 an average sorting accuracy of 90.89%, demonstrating its effectiveness in distinguishing
51 dense beans from less-dense ones with high reliability. Overall, this automated sorter pro-
52 vides a reliable alternative to manual processing, which significantly reduces human labor
53 and improves GCB quality, thereby strengthening the local coffee farmers and industry's
54 foundation and competitiveness.

55 *Index Terms*—computer vision, deep learning, density-based analysis, Arabica, green coffee
56 beans, sorting.

295 NOTATION

296	\mathcal{S}	a collection of distinct objects	160
297	\mathcal{U}	the set containing everything	160
298	\emptyset	the set with no elements	160
299	$ \mathcal{S} $	the number of elements in the set \mathcal{S}	160
300	$h(t)$	impulse response	150
301	$x(t)$	input signal represented in the time domain	150
302	$y(t)$	output signal represented in the time domain	150

303 Throughout this thesis, mathematical notations conform to ISO 80000-2 standard, e.g.,
304 variable names are printed in italics, the only exception being acronyms like, e.g., SNR,
305 which are printed in regular font. Constants are also set in regular font like j . Standard
306 functions and operators are also set in regular font, e.g., \ln , $\sin(\cdot)$, $\max\{\cdot\}$. Commonly
307 used notations are t , f , $j = \sqrt{-1}$, n and $\exp(\cdot)$, which refer to the time variable, frequency
308 variable, imaginary unit, n th variable, and exponential function, respectively.

309 **GLOSSARY**

310	matrix	a concise and useful way of uniquely representing and working with linear transformations; a rectangular table of elements
311	Functional Analysis	the branch of mathematics concerned with the study of spaces of functions

Chapter 1

330

INTRODUCTION

331 **1.1 Background of the Study**

332 Coffee is one of the most globally consumed beverages. It is a vital product in the global
333 market, with production reaching 168.2 million bags in 2022-2023. The coffee industry
334 is expected to grow even more in the coming years, with output projected to rise by 5.8%
335 in 2023-2024 [International Coffee Association, 2023]. In the Philippines, coffee holds a
336 strong cultural significance, with the local industry continuously expanding. The country is
337 the 14th largest coffee producer in the world. Locally, the industry is expected to grow at a
338 compound annual growth rate (CAGR) of 3.5% from 2021 to 2025, driven by small-scale
339 farm households [Santos and Baltazar, 2022]. With a growing popularity among coffee
340 enthusiasts, the demand for specialty coffee is increasing as well. Consumers are becoming
341 more selective about the quality of their coffee beans [Tampon, 2023].

342 To stay competitive in the rapidly evolving coffee industry, farmers carefully select
343 high-quality coffee beans for production. Grading green coffee beans is a crucial part of
344 coffee production, as it is directly associated with the quality of the cup quality of coffee
345 brews [Barbosa et al., 2019]. Coffee grading is a process in the industry that determines the
346 quality of coffee beans, using various parameters such as size, density, color, and defects,
347 ensuring that only high quality beans are selected for consumption [Córdoba et al., 2021].
348 The size of coffee beans is determined using a screen size and sorting procedure, where
349 the coffee beans are categorized into different screen sizes, with larger beans considered
350 higher quality [González et al., 2019]. The density of a bean can be calculated by the ratio
351 of its mass and volume, which greatly influences the roasting process and overall quality of
352 the coffee [Datov and Lin, 2019]. Color is also another indicator for quality, with darker
353 beans being preferred for their richer flavor profile. On the other hand, defects are classified

354 among 3 categories: Category 1 includes the most severe issues such as foreign matter
355 and black beans, Category 2 includes less severe defects like broken beans, and Category
356 3 includes minor defects like slight discoloration. Determining the quality of the coffee
357 beans in relation to their defect values is based on quality standards and grading systems
358 such as SCAA protocols guidance or the Philippine National Standard on Green Coffee
359 Bean [Bureau of Agriculture and Fisheries Standards, 2012].

360 Traditionally, this stage of assessing and categorizing coffee beans relies on visual
361 evaluation, which is time-consuming and labor-intensive, making it prone to human error.
362 One of the biggest challenges in coffee bean production is ensuring consistency in quality.
363 As the demand for specialty coffee continues to grow, there has also been an increase for the
364 need of more efficient and accurate sorting methods. The application of modern technology
365 can help reduce the labor costs and minimize human errors in these tasks. In recent years,
366 computer vision was used alongside various machine learning models and techniques, such
367 as convolutional neural networks (CNNs), support vector machines (SVMs), or K-nearest
368 neighbors (KNN) models, where the models were trained on labeled data to classify images
369 of coffee beans into different quality categories. The proposed study aims to utilize this
370 technology to develop a two-stage automated coffee bean sorting system using machine
371 vision and density-based analysis to categorize and identify defects, good beans, dense, and
372 less-dense green coffee beans.

373 1.2 Prior Studies

374 Identifying and sorting specialty-grade coffee beans can be strenuous since the traditional
375 way of classifying a specialty-grade coffee is by manually sorting the coffee bean batch and

376 classifying them according to the set of standards of the SCAA. The existing work aims
 377 to solve these problems through image processing and implementing deep learning-based
 378 models to automatically sort the coffee beans while achieving high accuracy. However,
 379 these solutions only automate detecting either one of the parameters such as defects, color,
 380 and size, while the proposed system considers density, color and defects all in one system.
 381 Hence, eliminating human intervention or labor. The table below shows the comparison of
 382 existing solutions to the researcher's proposal aligning with the traditional way of sorting
 383 coffee beans.

TABLE 1.1 SUMMARY OF THE LITERATURE REVIEW

Existing Literature	Description
Defect Detection	<p>The existing literature focuses on using various machine learning models such as YOLO, KNN, and CNN to detect defects in green coffee beans, through identifying visible defects like black spots, broken beans, discoloration, and more. These existing approaches heavily rely on visual characteristics and do not consider other key factors that affect green coffee bean quality like density, which can enhance classification accuracy. The proposed system integrates density and size analysis alongside the defecting various levels of defects on the coffee bean for a more holistic detection and classification.</p>

**Coffee Bean Grading and Quality Assessment**

The existing literature utilize algorithms such as artificial neural networks, support vector machine, and random forest to grade and classify coffee beans according to the specified grading system. These methods primarily focus on visual features of the beans, which do not account the bean's density and size, which are both essential factors for classifying specialty-grade coffee beans. Additionally, there is a lack of practical implementation of automated sorting systems, as these focus on simply classifying the beans. Through a two-stage process, the proposed system will take into consideration both the visual inspection and the density measurement, which leads to a more complete classification of coffee beans.

Automated Sorting and Classification System	<p>Research has been conducted on developing that automate the process of sorting coffee beans according to various parameters. Some studies focus on sorting defectives against non-defective, while others focus on other visual parameters like defects and roast profiles. These systems focus only on visual characteristics, without considering the actual size of the bean and its density as parameters for better classification accuracy. The proposed system will integrate the use of visual, density, and size parameters to enable a comprehensive automated sorting solution for classifying specialty-grade coffee beans.</p>

384

TABLE 1.2 COMPARISON TABLE ON EXISTING STUDIES

Proposed System	[Balay et al., 2024]	[Lualhati et al., 2022]
-----------------	----------------------	-------------------------

- | | | |
|---|---|--|
| <ul style="list-style-type: none">• Defect sorting using RFDETR, YOLOv12, and Vision Transformer models.• Considers classification of 7 defect types.• The system considers density parameters to sort out less-dense beans.• The system includes a graphical user interface for farmers to visualize the cumulative data of the defects present in the batch.• The system also includes AI-generated recommendations on the possible interventions for the farmers based on the data gathered from the sorting system. | <ul style="list-style-type: none">• Defect sorting using YOLOv8• The study considered only 6 types of defects. | <ul style="list-style-type: none">• Defect sorting using YOLOv2 and InceptionV3.• The study considered only 2 types of defects. |
|---|---|--|

385

1.3 Problem Statement

386

The Philippine coffee industry is a growing market, however it is stuck with using traditional methods in sorting green coffee beans. Often relying on manually sorting the beans, it exposes a number of problems that are apparent in the industry. Relying on manual sorting increases production cost which results in higher prices for quality coffee beans. To make the Philippine coffee beans more competitive to the exported beans, reducing the price is crucial. Another problem that is encountered in manual sorting heavily focuses only on the

387

388

389

390

391

392 physical attributes of the bean like size and appearance. There are standards that need to
393 be met, which forces the farmers to resort to manual sorting to comply with the standards
394 of the SCAA. The SCAA standards require a 300g batch of green coffee beans must not
395 contain any defects and the size consistency of the beans must not exceed 5% variance.
396 Another reason why coffee processors still opt to do manual sorting is because there are no
397 commercially available and reliable GCB sorting machines [Lualhati et al., 2022]. There is
398 a need for a coffee sorter that is able to efficiently and accurately sort GCB. Coffee bean
399 selection is carried out either manually, which is a costly and unreliable process [Santos
400 et al., 2020]. The manual sorting process limits scalability and quality control, putting the
401 strain on farmers as coffee shop owners' demands for high-quality coffee continue to rise
402 [Lualhati et al., 2022].

403 **1.4 Objectives and Deliverables**

404 **1.4.1 General Objective (GO)**

405 GO: The study aims to develop an automated (Arabica) green coffee bean sorter that
406 identifies good, less-dense and defective beans from an unsorted batch of coffee beans.
407 The system will utilize machine vision and density-based analysis for defect detection and
408 classification of the coffee beans, ensuring efficient coffee bean sorting.;

409 **1.4.2 Specific Objectives (SOs)**

- 410 • SO1: To gather and create a dataset consisting of 500 high-resolution images of
411 good Arabica green coffee beans and 200 high-resolution images per classification

- 412 of defective beans (Category 1 & Category 2).;
- 413 • SO2: To improve the synchronization between the machine vision system and the
414 embedded sorting mechanism, ensuring defect sorting of at least 20 beans per minute
415 for stage one, solving issues such as non-synchronization of the system.;
- 416 • SO3: To achieve an accuracy of at least 85% in classifying defective green coffee
417 beans using computer vision;
- 418 • SO4: To achieve an accuracy of at least 85% in filtering out less-dense green coffee
419 beans;

420 **1.4.3 Expected Deliverables**

421 Table 1.3 shows the outputs, products, results, achievements, gains, realizations, and/or
422 yields of the Thesis.

TABLE 1.3 EXPECTED DELIVERABLES PER OBJECTIVE

Objectives	Expected Deliverables
GO: The study aims to develop an automated (Arabica) green coffee bean sorter that identifies good, less-dense and defective beans from an unsorted batch of coffee beans. The system will utilize machine vision and density-based analysis for defect detection and classification of the coffee beans, ensuring efficient coffee bean sorting.	A Two-Stage Automated Coffee Bean Sorter System that identifies defective, good beans, and less-dense green coffee bean using machine vision and density-based analysis.

423 **1.5 Significance of the Study**

424 The study explores the implementation of machine vision and density analysis of an
425 automated coffee bean sorter that can identify and sort out the defective, less-dense and
426 good green coffee beans. This said system would aid coffee sorters to mitigate manual
427 labor and to ensure that the sorting process of the GCB are accurate. In order to test the
428 effectiveness of the system, the study would gather data and compare the time efficiency
429 and accuracy of the manual sorting by a an expert sorter to be compared with the proposed
430 system. The system proposes significance to specific parts of society as follows:

431 **1.5.1 Technical Benefit**

432 This study would benefit the academe as this introduces a significant advancement in
433 coffee bean sorting technology by implementing both machine vision and density-based
434 analysis to detect and sort good coffee beans, less-dense and separating defective ones. The
435 proposed system would mitigate manual sorting that leads into insufficiency like human
436 error and fatigue. The system would improve the overall efficiency by operating at a faster
437 rate compared to manual labor. As a result, it would serve as a proof of concept for the
438 implementation of machine vision and density-based analysis in agricultural industries
439 specifically in the Philippine coffee industry.

440 **1.5.2 Impact to the Coffee Industry**

441 The study would aid coffee farmers and producers, by providing an automated system that
442 ensures accurate sorting of Arabica green coffee beans, the system aims to have an accurate
443 output to help maintain to yield higher quality coffee beans and allows coffee businesses

444 to scale up their operations, increase the competitiveness of exporting those beans, and
445 meet demand more efficiently. The productivity given from the system would potentially
446 strengthen the foundation of local coffee producers.

447 **1.6 Assumptions, Scope, and Delimitations**

448 **1.6.1 Assumptions**

- 449 1. There would be a defective coffee bean from the green coffee bean test batch;
- 450 2. Identifying the defective coffee beans using the machine vision and density-based
451 analysis would be much more efficient and accurate than manually sorting them;
- 452 3. During testing, test batches will contain 50% good beans and 50% defective beans,
453 75% good beans and 25% defective beans, 25% good beans and 75% defective beans,
454 100% defective beans, and 100% good beans;

455 **1.6.2 Scope**

- 456 1. The study only focuses on Arabica green coffee beans;
- 457 2. The study has two stages, the first stage would segregate the defective green coffee
458 beans from the batch, then the second stage would identify the specialty-grade green
459 coffee beans depending on its density;
- 460 3. The study will only consider the following metrics for classification: Color, Shape,
461 Physical Characteristics, Density, and Texture.

462 4. The system is not designed to evaluate other coffee bean varieties or factors such
463 as moisture content, different coffee bean origins, bean size beyond the allowed
464 deviation, or post-roasting characteristics.

465 **1.6.3 Delimitations**

- 466 1. The batch of coffee beans to be used for testing and dataset collection will consist
467 solely of Arabica beans from the same origin, farmer, and processed in the same way;
- 468 2. The system is only limited to unroasted green coffee beans;
- 469 3. The batch of coffee beans to be used should only be dehulled and not sorted visually
470 and by density;
- 471 4. Since the system is considering several types of defects and density parameter, sorting
472 time is compromised;
- 473 5. The system is designed to perform individual scanning of each coffee bean;
- 474 6. Sizing will not be considered, as it may cause jamming in the system. However, a
475 maximum size deviation of 20% among beans will be allowed.
- 476 7. This study is limited to detecting only the most evident defect in a green coffee bean
477 when multiple defects are present. The system prioritizes the most prominent defect
478 based on visual characteristics and does not classify multiple defects per bean.

479 **1.6.4 Overview of the Methodology**

480 The rapid advancements in computer engineering have led to innovative solutions across
481 various domains, including artificial intelligence and embedded systems. This thesis

482 presents a novel approach to automated coffee bean sorting, addressing key challenges in
483 manual classification and proposing a two-stage system that integrates machine vision and
484 density-based analysis.

485 The study explores fundamental principles and technologies relevant to coffee bean
486 classification, including machine vision, deep learning, and density-based sorting. By
487 combining theoretical analysis with practical implementation, the proposed system aims to
488 enhance sorting accuracy, reduce human labor, and improve efficiency and quality output
489 in coffee production.

490 The study's objective is to create a dataset consisting of 500 high-resolution images of
491 Arabica specialty-grade green coffee beans from a certain origin, to ensure sufficient data
492 for training and validation of the algorithm in the machine vision system. The system will
493 capture real-time data on the visual and density characteristics of each green coffee beans,
494 to aid coffee farmers from sorting each coffee bean efficiently. In the succeeding chapters,
495 the study will delve into existing research on automated coffee bean sorting systems, with a
496 focus on machine vision, density analysis, and their applications in the coffee industry. The
497 study would explore gaps in current manual sorting practices and demonstrate the system's
498 ability to improve overall efficiency through implementing advanced technologies.

LITERATURE REVIEW

502

2.1 Existing Work

TABLE 2.1 REVIEW OF RELATED LITERATURE

Literature	Description of the Literature
[Balay et al., 2024]	This study focused on the development of an automatic green coffee bean sorter. The algorithm used is the YOLOv8 to train the model, while a Raspberry Pi was used in order to test the model along with the sorting mechanism. There are a total of 6 defects that the system can detect these are full black, partial black, chipped, dried cherry, shell and dried cherries. A total of 10 trial were done to effectively test the system. Out of the 10 trials, 9 trials were found to have an average target sensitivity of 97.8%, with an average time of 2 minutes and 32 seconds for a total of 100 beans.
[Amadea et al., 2024]	In this study, a system was developed to detect defects in Arabica green coffee beans. The study used two different models such as Detection Transform (DETR) and You Only Look Once version 8 (YOLOv8). Upon comparison, YOLOv8 showed strengths in defect detection. On the other hand, DETR model showed significant strengths than the YOLOv8 model when it comes to defect detection.

[de Oliveira et al., 2016]	This study constructed a computer vision system that outputs measurements of green coffee beans, classifying them based on their color. In the system, Artificial Neural Network (ANN) was used as the transformation model. On the other hand, the Bayes classifier was used in classifying the coffee beans into four (whitish, cane green, green, and bluish-green). The model was able to achieve a small error of 1.15%, while the Bayes classifier achieved a 100% accuracy. To concluded, the developed system was able to effectively classify the coffee beans based on their color.
[Balbin et al., 2020]	In this study, the objective is to provide better technology for local coffee producers to increase export-quality beans production. Thus, the study proposed a device that can evaluate the size, quality, and roast level of a batch of beans fed into the machine. The model used in the system was the Black Propagation Neural Network (BPNN), together with other image processing techniques such as K-mean shift, Blob, and Canny Edge. These techniques were used to extract the features of the beans and analyzed using RGB analysis.

[Pragathi and Jacob, 2024]	The paper discusses the use of machine learning algorithms such as KNN and CNN to classify the specialty type coffee bean for Arabica. The coffee bean quality of an Arabica can be classified by the number of defective coffee bean presents in a sample. The defects are classified into two categories named primary and secondary.
[Lualhati et al., 2022]	With the lack of a locally made green coffee bean sorter in the Philippines, the researchers aimed to design and implement a device that will handle the sorting. The paper discusses the development of a Green Coffee Bean (GCB) quality sorter. The system used a PID based algorithm and image processing algorithm for sorting. It utilized two cameras to capture images of both sides of the GCB, this was done to check for the quality of the GCB through a prediction test. The paper conducted a total of 5 tests, each with varying conditions. The designed system on average got an accuracy score of 89.17% and sorting speed of 2 h and 45 mins per 1 Kg of GCB.

[García et al., 2019]

The paper discusses the use of computer vision for quality and defective inspection for GCBs. The paper makes use of parameters such as color, morphology, shape, and size to determine the quality of the GCB. It makes use of the algorithm k-nearest neighbors (KNN) to differentiate the quality and to identify the defective beans. The designed prototype makes use of an Arduino MEGA board to gather the data and a DSLR camera to capture the GCB. The type of bean used was an Arabica, and a total of 444 grains were used to test the prototype. The accuracy score for both the quality evaluation and defective beans resulted in an average of 94.79% and 95.78% respectively.

[Akbar et al., 2021]

The researchers proposed a system that sorts the Arabica coffee into 2 classes, defective and non-defective. After the classification into two classes, the coffee beans are then graded based on the quality consisting of: specialty grade, premium grade , exchange grade, below grade, and off grade. Utilizing computer vision for classifying the defective and non-defective beans, the researchers used the color histogram and the Local Binary Pattern (LBP) to get the color and the texture of the beans. The data gathered from both the color histogram and LBP are used to train two models, the random forest algorithm and the KNN algorithm. The results from both algorithms are both promising, with an average accuracy score of 86.56% using the random forest algorithm and 80.8% for the KNN algorithm, However, this result shows that utilizing the random forest algorithm provided better accuracy scores for the model.

[Huang et al., 2019]

The paper discusses the development of a GCB sorter in real-time by using Convolutional Neural Network (CNN). The researchers used a total of 72,000 images of good and bad beans, 36,000 per category respectively. A total of 7,000 images for the beans were picked at random to test the model, while the remaining was used to train the model. To test the model, a webcam was used to record the coffee beans, however this resulted in capturing only the topside of the bean, to solve this the beans were flipped to provide accurate results. This resulted in an average accuracy score of 93.34% with a false positive rate of 0.1007.

[Luis et al., 2022]

The paper focuses on using You Only Look Once (YOLOv5) as the algorithm for detecting the defective GCB. The researchers used a Raspberry Pi camera to capture the images of the coffee beans. To test the effectiveness of the developed system a total of 45 trials were conducted with varying classification that the model was trained on. The model tested a total of 15 trials for each classification, these classifications are black, normal and broken. Each classification provided different accuracy results, for the blackened coffee bean, a total of 106 coffee beans were tested which resulted with an 100% accuracy by correctly identifying 106 blackened coffee beans. For the normal coffee bean, a total of 117 beans were used which resulted in an accuracy score of 91.45% since only 107 out of 117, were accurately classified. Lastly, a total of 104 broken beans were used, which resulted with an accuracy score of 94.23% since only 98 beans were correctly classified. The average accuracy score of the system developed resulted in an average of 95.11%.

[Santos et al., 2020]	In this study, the development of quality assessment of coffee beans through computer vision and machine learning algorithms. The main parameters that this study considers are the shape and color features of the coffee bean and they used machine learning techniques such as Support Vector Machine (SVM), Deep Neural Network (DNN) and Random Forest (RF), to identify the coffee beans' defect. The script written in Python Language was used to extract shape and color features of the coffee beans based on the datasets. Overall, the system had a very high accuracy (>88%) on classifying coffee beans through the models that have been developed.
[Arboleda et al., 2020]	The study proposed a novel solution that deals with the low signal-to-noise ratio. The study shows a way of extracting features of an image in context with green coffee beans. The researchers concluded a new edge detection approach for green coffee beans. It was achieved by using the heuristic approach in calculating the right values for the discriminant and finding the best pixel formation.

[Susanibar et al., 2024]	The proposed system aims to implement a GCB automated classification based on size and defects. The paper classified each bean into three different sizes. The system used two stages to identify the sizes of each bean. Firstly the entrance of the system was measured to ensure that the bigger beans are not able to pass through. The second stage involves the use of a cylindrical sieve with holes. This resulted with an average accuracy score of 96% for classifying the beans in size. However, the system does not provide a good accuracy score in classifying beans in terms of its defect since it only averaged 80% when classifying the defects of the beans.
[Srisang et al., 2019]	The study proposed an oscillating sieve as the main way for sorting Robusta coffee beans. Sizes are differentiated into 4 classes: extra large (XL), large (L), medium (M), small (S). The sieve resulted in an accuracy score of around 79% in classifying the sizes of the coffee beans.
[Muchtar et al., 2025]	This study focuses on defect detection in coffee beans using nine image detection models, consisting of five CNN-based models and four transformer-based models. The system is limited to identifying whether a bean is defective or not, without classifying the specific type of defect. Furthermore, the scope does not cover any sorting mechanism, as it only deals with defect identification.

503

504

2.2 Lacking in the Approaches

TABLE 2.2 COMPARING PROPOSED STUDY AND EXISTING STUDIES

Existing Studies	Proposed Study
<ul style="list-style-type: none"> Uses computer vision to classify green coffee bean grade based on its visual characteristics such as size, color, and shape. Most related studies classify defective and non-defective beans only. The density parameter of the green coffee beans is not considered. Similar study [Lualhati et al., 2022] only considered three classifications of GCBs: Good, Black, and Irregular-Shaped beans. Similar automated GCB sorter [Balay et al., 2024] only considered one side of the bean. Existing classification of GCBs with automated sorters do not have an integrated graphical user interface (GUI) for data analytics. 	<ul style="list-style-type: none"> Computer vision will be used to analyze the physical characteristics of the bean, including its volume. Density parameters will be considered by implementing a weighing scale to the system. The system will implement two stages of sorting: <ul style="list-style-type: none"> The first stage sorts out the defective beans. The second stage sorts out the potential specialty-grade beans based on their density and size. The system is designed to inspect both sides, utilizing two cameras. The system is designed with a GUI for farmers to visualize the cumulative data of the defects present in the batch.

505

2.3 Summary

506

The various related literature discusses the numerous technological advancements related to coffee bean sorting to aid coffee farmers and producers on efficient sorting and classification

508 of beans. These studies provide insights regarding the various methods used in the field
509 of coffee sorting that utilize machine vision, density-based analysis, and deep learning to
510 identify and classify coffee beans based on their physical parameters. Numerous studies
511 discussed parameters like size, defects, and color. However, existing studies tend to
512 focus primarily on visual characteristics and lack integration density analysis for accurate
513 classification of green coffee beans. The review literature identifies and acknowledges the
514 gaps in current sorting practices, such as the lack of comprehensive systems that implement
515 machine vision and density-based analysis. The study aims to address these gaps by
516 proposing a two-stage sorting system that automates both detection of defective beans and
517 the classification of less-dense beans. Density and size will play a significant role, as it is
518 linked to identifying the quality of the coffee bean. However, related literature mentioned
519 overlooks this parameter for classifying the coffee bean. Higher density beans are often
520 associated with higher quality coffee beans, into being potential specialty-grade coffee after
521 roasting and cupping.

522

Chapter 3

523

THEORETICAL CONSIDERATIONS

524

3.1 Theoretical Framework

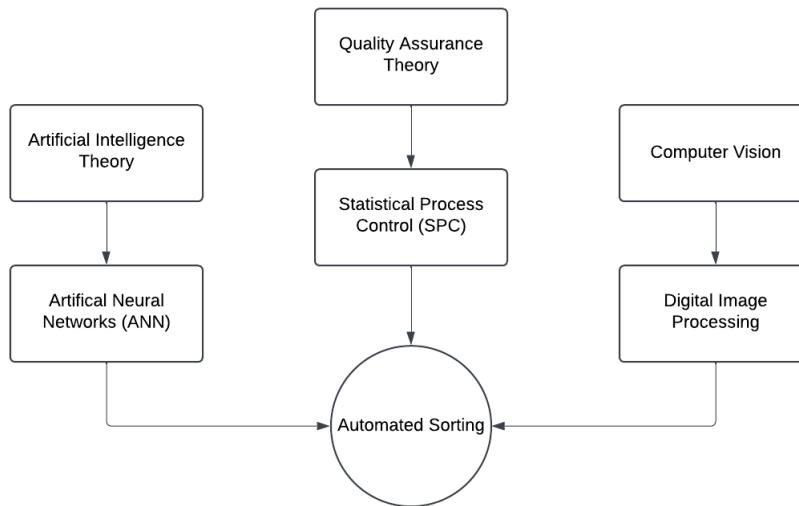

Fig. 3.1 Theoretical Framework

525

The theoretical framework discusses the multiple concepts that are involved in this study. These key concepts are crucial to ensuring the success of the thesis. There are three main concepts that are key to this study, the Artificial Intelligence Theory, the Quality Assurance Theory and lastly, Computer Vision.

529

3.2 Conceptual Framework

530

The conceptual framework shows the implementation of two systems which consists of machine vision and embedded systems. The framework describes the thought process of both systems with the end goal of integrating both systems. The machine vision handles the defect classification of the system, whereas the embedded system handles the sorting of

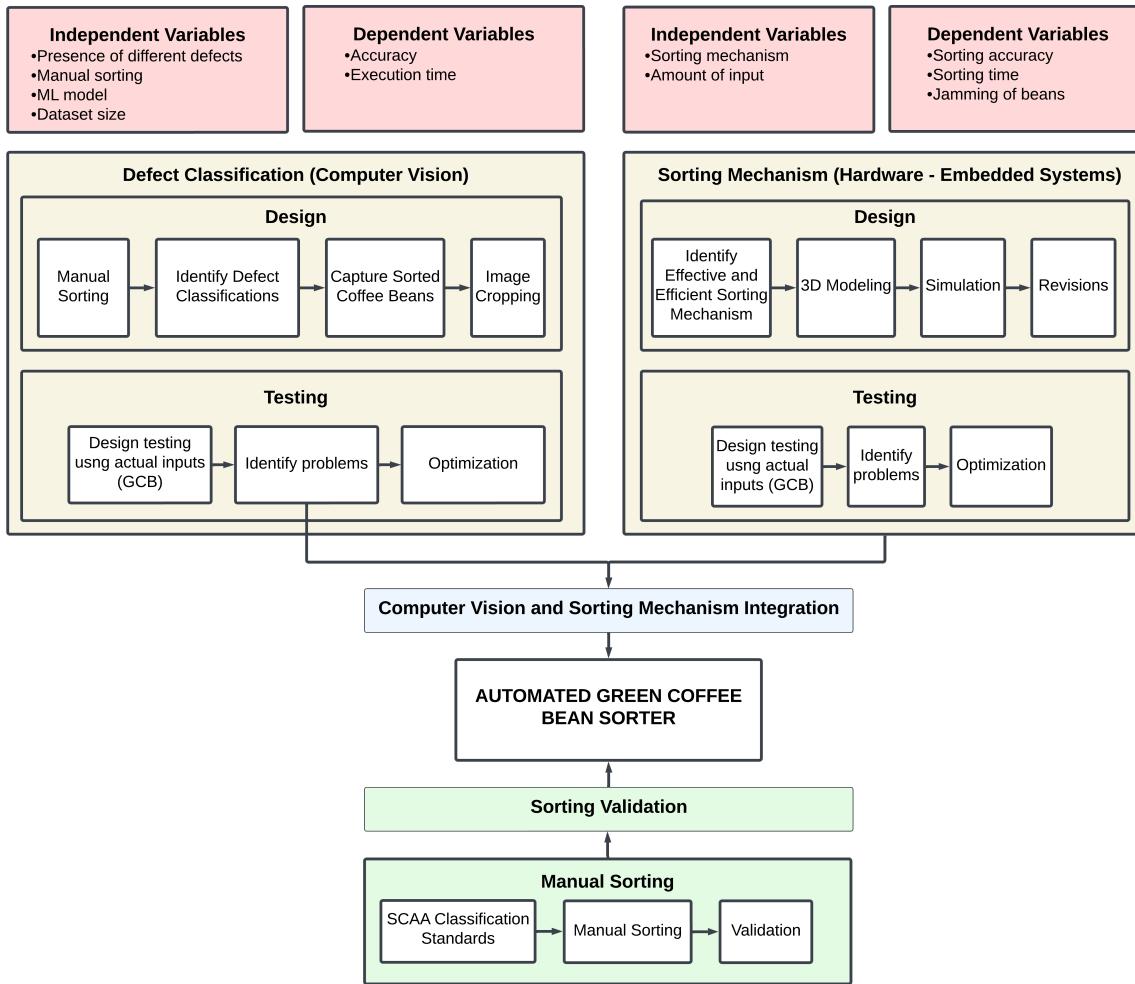

Fig. 3.2 Conceptual Framework

534 the beans. By integrating both systems together, creates an automated green coffee bean
 535 sorter. The data validation is done by sorting through the tested coffee beans by the system
 536 following the standards of the SCAA.

537 **3.3 Quality Assurance Theory**

538 Quality assurance theory refers to the set of principles and practices that focuses on estab-
539 lishing a systematic process to ensure that a product or service conforms to a predetermined
540 standard. In the aspect of food and agriculture, there are a number of practices and prin-
541 ciples that ensure the safety and quality of food products. According to [da Cruz et al.,
542 2006], there are a number of practices in place that must be followed, one of which is
543 Good Agricultural Practices, where these procedures are aimed to reduce hazards related to
544 product safety at the farm level. Another one of said practices is the Good manufacturing
545 practice, which were formerly called support programs that provide foundations to the
546 overall food safety management programme. This includes cleaning, maintenance, person-
547 nel training, calibration equipment, quality control, and pest control. Industries that adopt
548 such practices produce the following results, better quality products, greener initiatives
549 and better productivity within a department. Lastly, hazard analysis and critical control
550 points (HACCP), is a science-based system that was created to identify potential hazards
551 and actions to control said hazards. This practice is used to ensure food safety.

552 In the context of coffee beans, there are a number of systems in place to ensure that
553 quality beans are being provided to the consumer market. The governing body known as
554 the Specialty Coffee Association (SCAA) has implemented grades to green coffee beans
555 to provide a better way to classify said beans. These grades can be differentiated into 5
556 grades namely, Specialty Grade, Premium Coffee Grade, Exchange Coffee Grade, Below
557 Standard Coffee Grade, and Off grade Coffee. They are classified according to the number
558 of defects found in a sample batch of 300 grams and according to their size. Specialty
559 grade coffee beans are supposed to contain less than 5 defects in a sample batch while also

560 not allowing any primary defects to be present; it should only have less than 5% difference
561 between its sizes. Coffee beans in this grade should also contain a special attribute whether
562 in its body, flavor, aroma, or acidity, and its moisture content should only be in the range
563 of 9-13%. Premium Coffee grade beans should only contain 8 full defects in a sample
564 batch but primary defects are allowed in the sample batch. Similarly to specialty grade
565 coffee beans, its sizes should only contain a 5% difference to one another; it should also
566 contain a special attribute and moisture content should also be similar to its specialty grade
567 counterpart. Exchange coffee grade should contain defects ranging from 9-23 beans in a
568 sample batch, with sizes that can vary up to 50% difference in weight but also only 5% in
569 its sizes. Below standard and off grade coffee beans are classified according to the number
570 of defects present in a sample batch; 24-86 beans for below standard while more than 86
571 beans for off grade. These gradings are used to ensure that quality green coffee beans are
572 produced and ensure that consumers are provided with the best quality available.

573 3.4 Artificial Intelligence Theory

574 Artificial Intelligence in defect classification are widely used in this industry which are
575 commonly used in manufacturing and industrial applications. Several deep learning tech-
576 niques are used in order to achieve an effective defect classification. Models such as
577 convolutional neural networks (CNNs) and You Only Look Once (YOLO) are widely used
578 for classification. CNN utilizes an image based analysis and feature extraction approach
579 to identify different classifications. CNN is more effective in analyzing grid-like data like
580 images, making it suitable for defect classification [Das et al., 2019]. One of its major
581 advantages is its ability to automatically detect important features such as shape, patterns,

582 and edges. Although it may have its own advantages, there are also disadvantages that need
583 to be taken into account, mainly in scenarios that involve class imbalance and complex
584 backgrounds (Moon, 2021) . YOLO is another model that is suitable for defect classifica-
585 tion, its ability to provide real-time defect classification while also providing high accuracy
586 is essential in some industries. In YOLO, there are several versions that are developed over
587 the years, which are supposed to bring several improvements in terms of speed, accuracy,
588 and computational efficiency. Combining different models is also effective, in the case
589 of [Deepti and Prabadevi, 2024], they combined transformer architecture with YOLOv7
590 to enhance its feature extraction, this resulted in an increase of 5.4% in mean average
591 precision and F1 score.

592 **3.5 Computer Vision Theory**

593 There are fundamental concepts that need to be done for image processing in detection.
594 There are pre-processing techniques like preprocessing and segmentation. Pre-processing is
595 a general term for preparing an image to be analyzed by the system, this includes techniques
596 such as denoising an image, applying filters, and enhancing the image to further improve
597 the visibility of defects [Lee and Tai, 2020] . Segmentation is dividing the images into
598 segments to make the analysis simpler, methods such as histogram segmentation and active
599 contour models helps in isolating the regions of interest.

600 For defect classification, feature extraction is important to identify the relevant features
601 then extracting said features to help indicate specific defects, this utilizes the edges,
602 textures, and shapes to help in defect classification [Wu et al., 2024]. By utilizing OpenCV
603 and deep learning models is advisable for automatic feature extraction. Models like CNN,

604 can automatically extract features from images, which greatly reduces the need for manual
605 extraction, this helps in a more robust and scalable solution [Bali and Tyagi, 2020]. The
606 versatility of OpenCV library which allows support for multiple image pre-processing tasks,
607 when combined with deep learning models can be applied to different fields.

608 **3.6 Performance Evaluation**

609 Accuracy, precision, recall, and F1 score are common measures to assess how well clas-
610 sification models predict. Accuracy measures how good a model is by computing the
611 ratio of correct predictions to all predictions. While appropriate for balanced datasets,
612 accuracy can be deceptive when dealing with imbalanced classes, since a model can be very
613 accurate by predicting the majority class. Precision measures how well positive predictions
614 are obtained by calculating the number of correct predicted positive instances. This is
615 particularly important when false positives are costly, such as in the case of spam. Recall,
616 or sensitivity, measures how well a model identifies true positive instances, which is very
617 important in cases where failing to detect a positive instance is costly, such as in medical
618 diagnosis. Since precision and recall trade off each other, the F1 score reconciles the two by
619 computing their harmonic mean. This measure is particularly appropriate when a trade-off
620 between precision and recall is desired, so that neither false positives nor false negatives
621 dominate the assessment. In general, these measures provide a general impression of how
622 good a model is and help decide how well-suited the model is for different applications.

623 3.7 Existing Technologies and Approaches

624 The paper done by [Lualhati et al., 2022], is a green coffee bean sorter that utilizes
625 MATLAB as its image processing. The system created uses a PID based algorithm and
626 image processing algorithm for sorting. The system utilized two cameras to capture both
627 sides of the bean. The system of Lualhati et al. comprises only 3 green coffee bean
628 classifications, which are good, black and deformed coffee beans. The developed system
629 uses multiple stepper motors for the defect sorting, while 2 cameras were used to handle
630 the green coffee bean detection.

631 The paper of [Balay et al., 2024], is an automatic sorting for green coffee beans utilizing
632 computer vision and machine learning for defect classification. The system developed
633 uses the YOLOv8 model alongside a Raspberry Pi based image processing to identify
634 and classify the green coffee beans. The defects that the group classified are full black,
635 partial black, chipped, dried cherry, shell, and insect damage. The system developed uses a
636 conveyor belt and sorting motor for an automated defect separation. They used one camera
637 module, the raspberry pi camera module 3 NoIR for the defect detection of the system.

638 The study of [Muchtar et al., 2025] explored the use of 9 image classification models
639 with varying architectures such as CNN-based (EfficientNetB7, DenseNet121, InceptionV4,
640 etc.) and Transformer-based models (ViT, Swin Transformer, FocalNet, etc.) in detecting
641 defective coffee beans. The study focuses on differentiating defective from good coffee
642 beans, but doesn't distinguish between defects. The results of the study suggest that
643 FocalNet outperforms all other models significantly in both training and testing phases for
644 detecting defects in coffee beans.

645 **3.8 Density Measurement**

646 In measuring the density of the coffee bean there are a number ways this can be done, one
 647 way is by measuring the bulk density of the batch. This is done by measuring the mass of a
 648 batch then dividing it to a fixed volume. The more appropriate method for measuring the
 649 density of the coffee bean is called “free settle” density or free-flow density. This is defined
 650 as the ratio of the mass of the coffee beans to the volume they occupy after being allowed to
 651 flow freely into a container. It is expressed in grams per liter or kilograms per cubic meter.

$$652 \quad d = \frac{m_2 - m_1}{V} \quad (3.1)$$

653 where m_2 is the mass of the green coffee bean, m_1 is the mass of the empty container,
 654 and V is the capacity (in liters) of the container [International Organization for
 Standardization, 1995].

655 **3.9 Summary**

656 This chapter gives the theoretical and conceptual backgrounds of an automated green
 657 coffee bean sorter using Artificial Intelligence (AI), Quality Assurance, and Computer
 658 Vision. The theoretical background focuses on key concepts like deep learning models
 659 (CNNs, YOLO, ViT) used for defect classification, quality assurance principles (GAP,
 660 GMP, HACCP) ensuring food safety, and computer vision algorithms (preprocessing,
 661 segmentation, and feature extraction) used for image analysis. The conceptual background
 662 explains the integration of machine vision for defect detection with embedded systems for
 663 sorting, thus conforming to the SCAA coffee grading standards. Performance metrics like

De La Salle University

accuracy, precision, recall, and F1 score are used for evaluating the performance of the model. Current technologies, for instance, those of [Lualhati et al., 2022] and [Balay et al., 2024], provide insights relevant to image processing and machine learning-based sorting techniques, thus contributing to automated coffee bean classification development.

668

Chapter 4

669

DESIGN CONSIDERATIONS

670 **4.1 Mechanical Design**

671 **4.1.1 Screw Feeder**

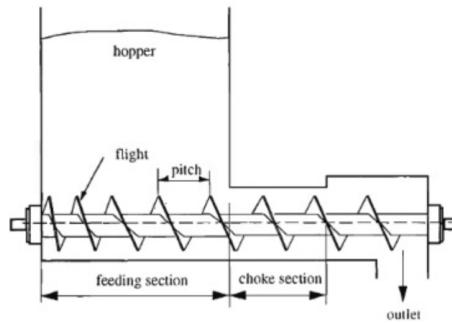

Fig. 4.1 Screw Feeder Diagram

672 Figure 4.1 shows the diagram of a screw feeder. Screw feeders are usually used in
673 industrial fields like agriculture, chemicals, plastics, cements, poultry and food processing.
674 According to [Minglani et al., 2020], screw feeders are specifically used to transport or
675 move granular materials at a controlled rate like corn and wheat. It consists of a rotating
676 screw and small feeding section or the hopper. Despite having big batches of a certain
677 material, screw feeders can control the rate of which these materials are dispensed. With
678 this concept, the group decided to utilize a screw feeder as the input mechanism for the
679 system. This mechanism allows a controlled rate of coffee bean dispensing, which is a
680 significant factor to avoid overcrowding in the rotating conveyor table causing the beans to
681 jam. In addition, batches of coffee beans can be put at once instead of just adding a certain
682 amount of beans at a time.

Fig. 4.2 Rotating Conveyor Table 3D Design, 32-inch Rotary Table Accumulator (RTA)

4.1.2 Rotating Conveyor Table

After the inputted beans come out from the screw feeder, the coffee beans would then be placed in the rotating conveyor table. According to the study of [Dabek et al., 2022]. The conveyor table is used as a transportation system for all forms of bulk materials to a certain machine or destination. The system utilizes the rotating conveyor table to have a controlled movement of coffee beans towards the first stage of the system. The improvised linearization system, consisting of metal guide rails and dividers ensures that beans align in a single path, reducing random movement, and improving the flow of the input beans. An infrared sensor would detect each bean as it passes, to control the movement of the bean preventing clogging and ensuring efficient operation.

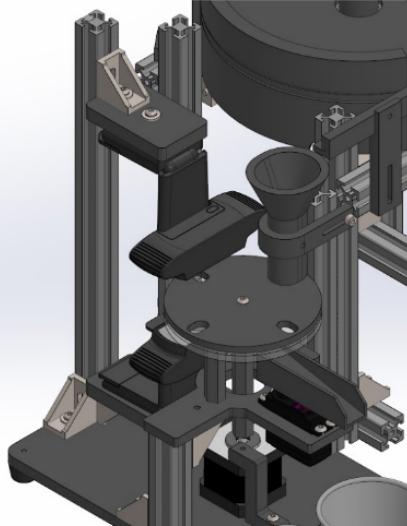

Fig. 4.3 Inspector Tray 3D Design

693 **4.1.3 Inspection Tray (1st Stage)**

694 The inspection tray serves as the platform for the machine vision based analysis of coffee
695 beans. It is designed with 8 holes, allowing uniform placements and optimal camera
696 positioning for the system. The system utilizes a two-layer structure: a stationary acrylic
697 platform and a rotating 3D-printed platform with holes. The rotating mechanism sequen-
698 tially positions each bean between two webcams, which captures and analyzes its physical
699 characteristics from top and bottom perspective. This design captures both sides of the
700 bean, ensuring a better classification of the bean. After inspection, the bean moves onto a
701 slide, where it is either directed to the second stage for density analysis (Good) or sorted
702 out as a defect.

703 **4.1.4 Density Sorter (2nd Stage)**

704 In measuring the density of the coffee bean there are a number ways this can be done, one
705 way is by measuring the bulk density of the batch. This is done by measuring the mass of a
706 batch then dividing it to a fixed volume. The more appropriate method for measuring the
707 density of the coffee bean is called “free settle” density or free-flow density. This is defined
708 as the ratio of the mass of the coffee beans to the volume they occupy after being allowed to
709 flow freely into a container. It is expressed in grams per liter or kilograms per cubic meter.

710 **4.2 Embedded Systems**

711 **4.2.1 Microcontroller**

Fig. 4.4 Arduino UNO Microcontroller

Fig. 4.5 Arduino Nano Microcontroller

712 Since the system is composed of two stages of sorting—defect sorting through computer
713 vision and density-based analysis—the group decided to utilize two Arduino UNO and one
714 Arduino Nano microcontrollers to modularize the control process.

715 The first Arduino Uno microcontroller is tasked to handle the computer vision-based
716 defect sorting through serial communication with OpenCv operating in Python. In addition,
717 it handles the operation of defect sorting consisting of a stepper motor for the rotation of the
718 inspection tray and a servo motor for the slider, which directs the beans to the designated
719 bin (defect or good bin).

720 On the other hand, the second Arduino UNO microcontroller manages the density-based
721 analysis and sorting, which consists of another stepper motor to direct the beans to its
722 respective bin (dense and less-dense bin), the precision scale which is interfaced through
723 RS232, and the top feeder where the input beans are poured.

724 The use of separate Arduino microcontrollers is advantageous when it comes to the
725 computer vision-based sorting of beans. This is because serial communication is much
726 faster when code complexity is significantly reduced. With this, a designated microcon-
727 troller handles the computer vision part and two-way serial communication between the
728 microcontroller and the computer vision algorithm running in Python. Most importantly,

729 the use of two microcontrollers allowed the system to not rely solely on a sequential ap-
730 proach. This means that the two stages of sorting are not relying on the timing of each other,
731 allowing the inspection tray and the top feeder to operate independently. Thus, resulting in
732 a much faster and efficient sorting process.

733 **4.2.2 Sensors**

Fig. 4.6 Infrared Sensor

734 To ensure that the beans are falling in a one-by-one manner onto the inspection tray, the
735 group placed an IR sensor at the edge of the top feeder. This IR sensor triggers the DC
736 motor that runs the feeder to stop, and runs small steps until the bean is dropped. The
737 addition of the IR sensor at the edge of the feeder allows the motor to run continuously
738 until another bean is detected. With this, the waiting time for the next bean at the inspection
739 tray is significantly lessened.

740

4.2.3 Motor control

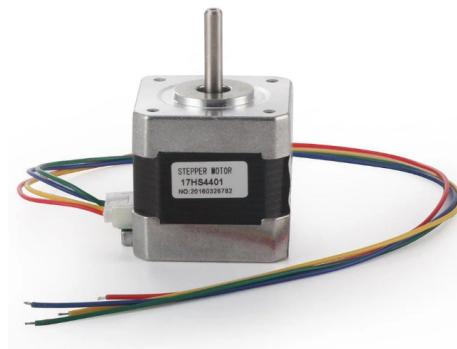

Fig. 4.7 12V NEMA 17 Stepper Motor

741

Two NEMA 17 12V stepper motors, paired with L298N motor drivers were used to control the movement of the inspection tray in the first stage and the density-based sorting mechanisms in the second stage. In these mechanisms, the group decided to use stepper motors to ensure precise and accurate movements. Precise and accurate movements are needed for the inspection tray to make sure every movement of the hole is perfectly aligned to the camera. Thus, allowing a more uniform and consistent angle for each bean to be inspected through the computer vision. In addition, NEMA 17 stepper motors were the best choice for these mechanisms due to its high torque, which is essential because it will be moving weighted objects.

Fig. 4.8 6V DC Motor

750 For the rotating conveyor table (top feeder), where the beans are initially poured, a
751 6V DC motor is used. The group decided to use this motor due to its high RPM, which
752 is needed for a fast rotation of the rotating conveyor table. The speed of the feeder is
753 regulated to prevent clogging and ensure that the beans are evenly spaced before they
754 enter the inspection tray. The motor speed is fine-tuned through pulse-width modulation
755 (PWM) to synchronize with the stepper motor-driven inspection tray, ensuring a steady
756 input without overwhelming the system.

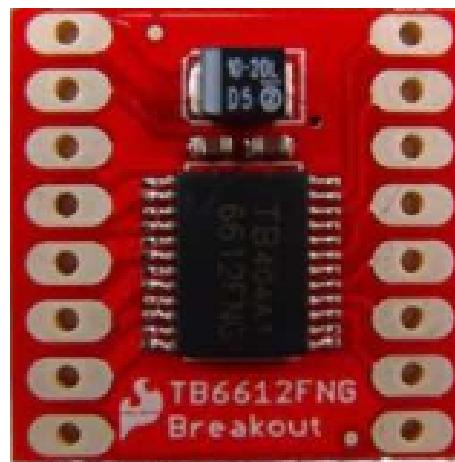

Fig. 4.9 TB6612FNG Motor Driver

757 To drive the 6V DC motor, the group utilized TB6612FNG, a motor driver module.
758 This module also allowed PWM control for the motor, which is essential for reducing the
759 speed of the motor when needed.

760 **4.2.4 Operating Voltage**

Fig. 4.10 12V Power Supply

761 The main power supply comes from a 12V external power supply, which provides enough
762 voltage for all the components and keeps the voltage from dropping and interfering with
763 system performance. The Arduino microcontroller is powered via its VIN pin, so it can
764 function without the need for a USB connection and maintains a stable 5V logic output
765 for sensor and actuator control. The NEMA 17 stepper motors that operate the inspection
766 tray and density sorter are directly powered from the 12V supply and fed into L298N
767 motor drivers to adjust voltage and monitor current flow. Operating these motors at 12V
768 provides best torque output, which is vital in ensuring consistent movement during the
769 sorting process.

Fig. 4.11 MT3608 Step-Up Module

770 For the top feeder mechanism, a step-up module is needed to supply the sufficient
771 voltage needed for the motor—6V. From the 5V output of the Arduino, the step-up module
772 will be utilized to convert it into 6V.

773 4.3 Computer Vision System

774 4.3.1 Image Processing

Fig. 4.12 C920 Camera

775 The system requires clear images of the coffee beans for accurate processing by the detection
776 and classification models. Two C920 cameras will be used to capture images from opposite
777 sides of each bean—one positioned on top and the other at the bottom. The captured images
778 will then be processed within the laptop using the detection and classification models to
779 identify and categorize the beans.

780 **4.4 Serial Communication**

781 Serial communication is used for sensors and motors for arduino due to the simplicity,
782 reliability and efficient transfer of data between different devices. The precision scale uses
783 a RS232 and a MAX TTL converter to send the data from the precision to the arduino
784 to get the weight values of each green coffee bean. To sort out the good from defective
785 beans the system utilizes a servo motor. The data from python is received by the arduino
786 through serial communication. The python side is responsible for the decision and defect
787 classification while the arduino is responsible for controlling the servo motor.

788 **4.5 Graphical User Interface (GUI)**

789 The proposed system would be integrating a graphical user interface developed using PyGui
790 and ChatGPT API. The GUI would serve as the control center platform for the system. This
791 would provide real-time feedback and insights for users. As shown in Figure 8, a concept
792 of how the GUI would interact with the system would be a start button, once the button
793 is executed the system would then be expecting inputs and start sorting. There would be
794 real-time feedback during the sorting process, then some visual markers to indicate their

Fig. 4.13 Graphical User Interface

795 classification, and an elapsed time so the user would be aware of the time of the sorting
 796 process. Once the system is done, the user can click the end button and the summary report
 797 would generate in an orderly manner, providing tables of classification that was detected
 798 through the process. In the bottom part of the GUI, ChatGPT API would be integrated and
 799 would offer recommendations based on the detected quality and classification of the coffee
 800 beans.

801 4.6 Density Analysis

802 The density analysis works by using a precision scale to measure the mass of the bean. To
 803 get the data from the precision scale, serial communication is used from the scale to an
 804 arduino nano. This is done by using a RS232 with a Max TTL converter for the arduino to
 805 read the data from the precision scale. To sort out the good from defective beans the system
 806 utilizes a servo motor for the density sorting mechanism. The servo motor is used to sort
 807 the dense from the less dense beans. The sorting mechanism developed consists of gears
 808 and cross-shaped modules to properly capture the beans and properly sort them out.

809 **4.7 Technical Standards**

810 **4.7.1 Hardware**

811 In the design and development of the system, the group incorporated and followed a series
812 of technical standards. One of which is ISO 12100:2010 – Safety of Machinery, where
813 general principles for risk assessment and reduction are discussed. Thus, the system is
814 designed, while keeping in mind the hazards associated with moving parts, making sure
815 that all moving parts in the system do not need to be touched for operations. An emergency
816 stop is also integrated into the system to stop all the moving parts in case of undesirable
817 incidents [International Organization for Standardization, 2010].

818 On top of this, ISO 14121-1 – Risk Assessment for Machinery was also followed to
819 further assess the potential risks throughout the system. The standard includes identify-
820 ing and quantifying hazards such as electrical short circuits, faulty wirings, and motor
821 overheating [International Organization for Standardization, 2007]. With this, the system
822 included protective enclosures for the electrical wirings, proper grounding of the circuits,
823 and controlled motor actuation. More specifically, for motors, it was made sure that the
824 design has sufficient voltage and ampere to power the different kinds of motors used with
825 the use of L298N, and MT3608 modules. These are the main components for adjusting
826 motor speeds dynamically during the sorting process.

827 Lastly, ISO 30071-1 was standard used to provide sufficient lighting during data
828 collection, and real time bean inspection during sorting process. This standard helps ensure
829 consistent and non-glare lighting conditions, which are essential for the machine vision
830 cameras to accurately capture bean features [International Organization for Standardization,
831 2019]. Uniform illumination improves the reliability of image classification by reducing

832 shadow artifacts and reflections, thereby enhancing overall detection performance.

833 **4.7.2 Software**

834 For the software side of the system, the first applicable standard is ISO/IEC 25024 – Sys-
835 tems and Software Engineering – Measurement of Data Quality, which offers a systematic
836 method for measuring the quality of datasets utilized in information systems [International
837 Organization for Standardization, 2015]. This standard was used during the dataset gather-
838 ing and training for the different coffee bean defects like black, sour, insect damage, fungus
839 damage, broken, floaters, and dried cherry. Practically, this included pre-processing the
840 image data to eliminate noise, balance class distribution, and verify ground truth labels.

841 Lastly, ISO/IEC 23053 – Framework for Artificial Intelligence (AI) offers a reference
842 architecture to build and integrate machine learning building blocks [International Organiza-
843 tion for Standardization, 2022]. This standard was highly applicable in determining the
844 design of the machine vision module, where a pre-trained deep learning model is utilized
845 for the classification of bean defects. This standard provides guidelines on best practice for
846 the overall machine learning cycle, ranging from data acquisition, feature extraction, and
847 model training through to model evaluation, deployment, and monitoring.

848 **4.7.3 Green Coffee Bean Sorting**

849 For sorting green coffee beans, Specialty Coffee Association of America (SCAA) Standards
850 for Green Coffee Bean Sorting was incorporated to maintain conformity. The standards
851 set the definition for the classification of primary and secondary defects (i.e., black, sour,
852 insect-damaged, broken, and floater beans) and sets the maximum allowable defect counts

De La Salle University

853 for specialty-grade coffee. The SCAA standards were applied to mark the training set of the
854 machine vision model and also to set up the thresholds of defect classification, so visually
855 defective beans can be correctly classified and rejected. Also, the sorting mechanism based
856 on density points towards SCAA bean weight and volume guidelines using a precision
857 scale and ToF sensor to sort beans based on within-acceptability density limits.

858 On the other hand, the system also adheres to PNS/BAFS 341:2022, the Philippine
859 National Standard for Agricultural Machinery – Coffee Green Bean Grader – Specifications
860 and Methods of Test [Bureau of Agriculture and Fisheries Standards, 2022]. It sets local
861 criteria for testing coffee grading equipment on performance, safety, construction aspects,
862 and methods of test. For the purposes of this research, PNS/BAFS 341:2022 is used as a
863 reference for the design of the sorting mechanism, specifically in terms of the materials
864 used in construction, handling of beans, and the efficiency with which the mechanical and
865 electronic subsystems segregate. It also guides the testing procedure employed to verify
866 sorting precision, capacity, and rates of misclassification under test conditions.

867

869

5.1 Description of the System

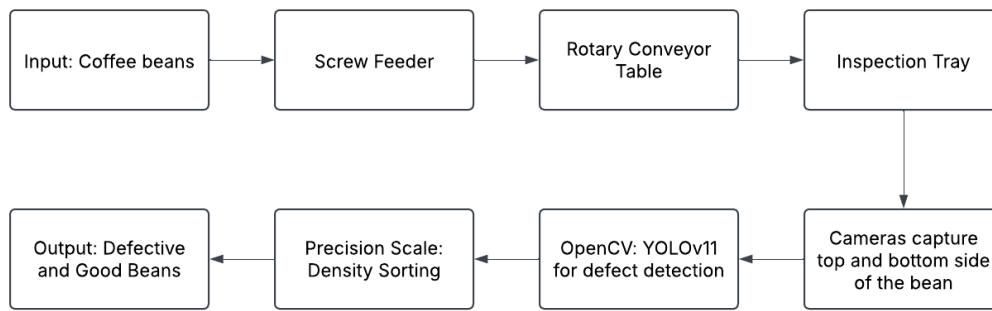

Fig. 5.1 System Block Diagram

870

The system is an automated green coffee bean sorting machine, utilizing machine vision. Firstly, the coffee beans are introduced into the system through a funnel, which directs them to a conveyor belt mechanism. The green coffee beans are sorted depending on their visual characteristics. In this process, the physical qualities of the bean are analyzed such as size, color, and defect. If the bean is defective, the system will automatically sort it out. Then, all the non-defective beans will go through the second stage of the system. In the second stage, there will be a precision scale. With the volume and mass of the bean in hand, the density of the bean can be estimated. Depending on the density threshold set by the user, the bean will be classified whether it is good or not.

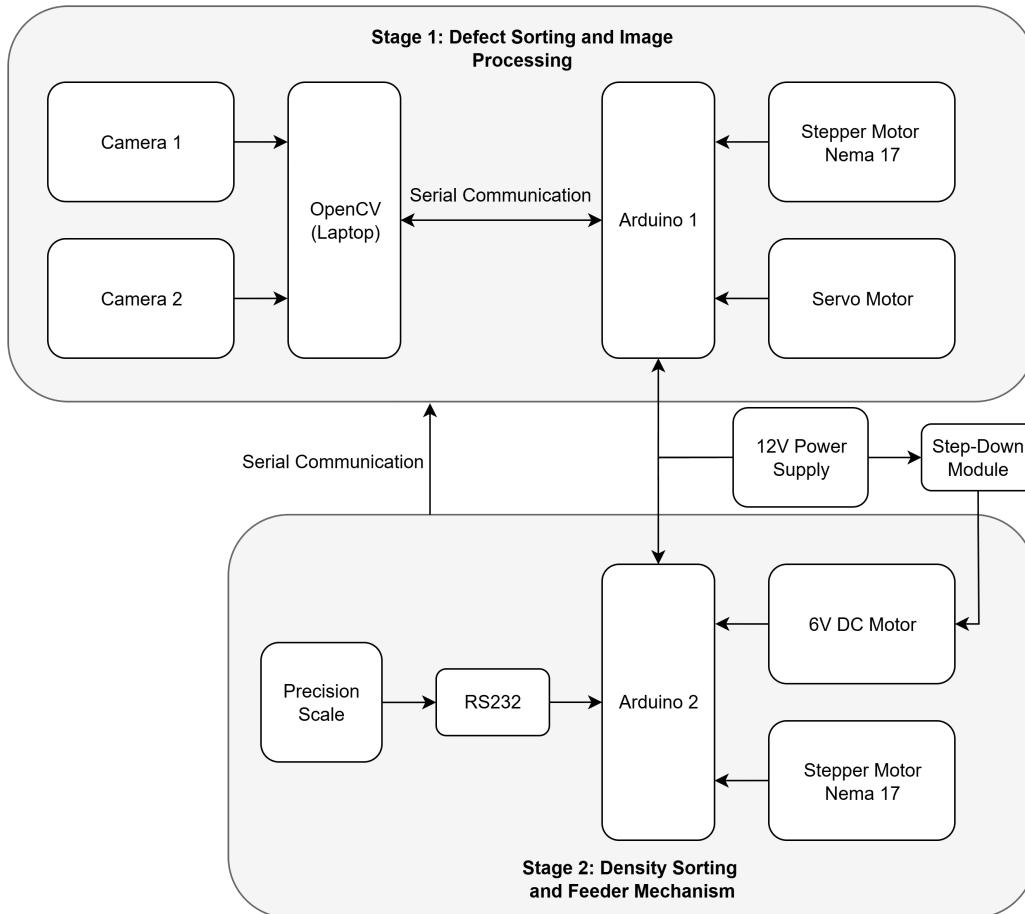

Fig. 5.2 Schematic Diagram of the System

Figure 5.2 shows the schematic diagram of the proposed system. Arduino Uno microcontroller makes all the mechanical components such as the servo motor, stepper motors, and the conveyor belt. The servo motor controls the rotating mechanism for bean sorting. On the other hand, the stepper motors operate a slide mechanism to direct the beans. Two cameras, integrated with OpenCV via Python, handle machine vision algorithms, and image processing for defect detection of the beans. A ToF10120 sensor provides precise distance measurement. A precision weighing scale measures the density of each bean

886 for classification. The Arduino communicates with the OpenCV system through serial
 887 communication, ensuring smooth coordination.

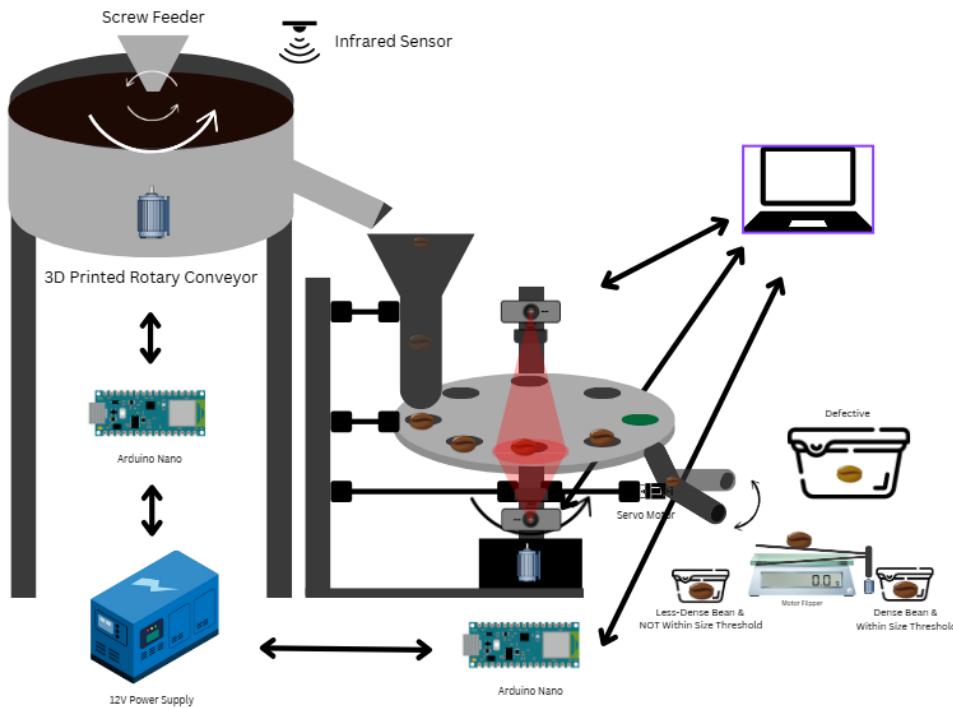

Fig. 5.3 Design Overview of the System

888 Figure 5.3 shows the design overview of the system. Beans are first arranged through a
 889 hopper and a conveyor belt. On top of the conveyor belt, a 3D-printed guide is attached for
 890 the beans to maintain a linear formation. Then, the beans are expected to fall into another
 891 funnel attached to a tube. The tube is directly attached to a rotating mechanism that allows
 892 the beans to be inspected and sorted one-by-one. In this stage, defective beans are sorted
 893 out. Then, the non-defective beans are transferred onto the precision scale to analyze the
 894 density. The less-dense beans are sorted out of the batch.

895

5.2 Research Design

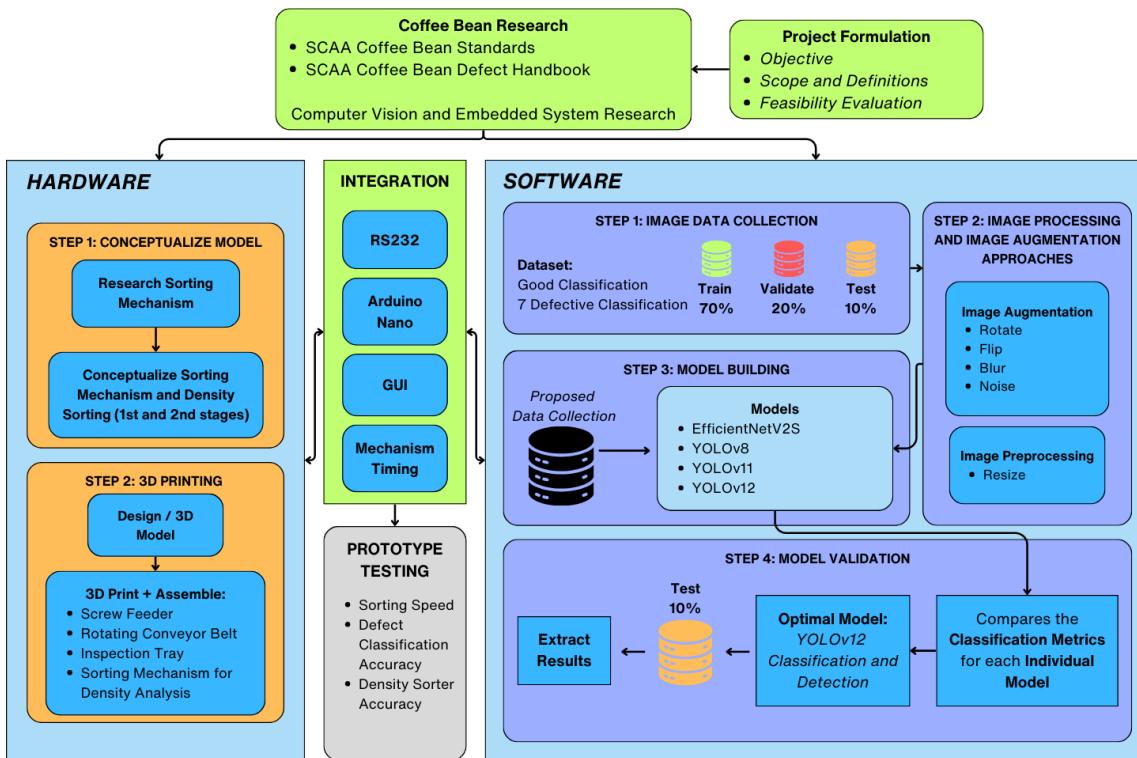

Fig. 5.4 Design and Development Research (DDR) Methodology

896

The researchers opted for a Design and Development Research model for the research.

897

As shown in Figure 5.4, there are multiple levels that were needed in order to develop a

898

working prototype for the system.

899

5.3 Dataset Collection

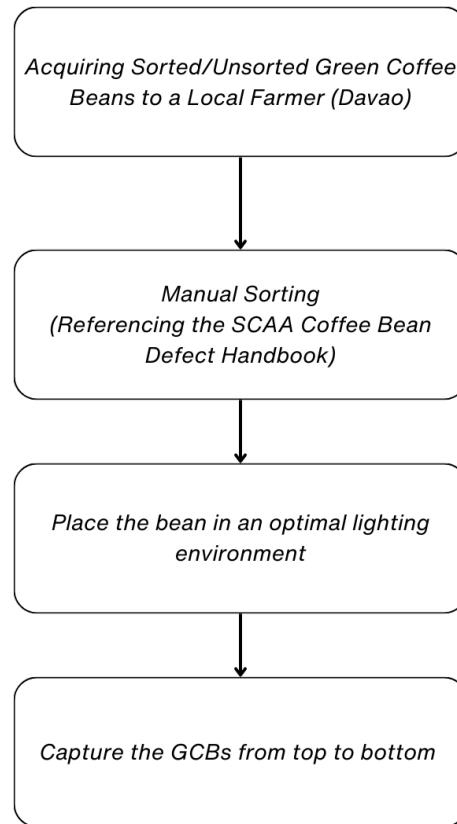

Fig. 5.5 Data Collection Process

900 901 902 903 904 905 906

For dataset collection, Arabica green beans from a farm will be used. Each bean will be captured by a high-resolution camera under sufficient and consistent lighting. Proper lighting is crucial, as it directly affects the visibility of the bean's physical features, minimizing shadows, grain, and other noise that could result from inconsistent illumination. The top and bottom side pictures of the beans are to be collected. In addition, defective beans of the same type and origin will be gathered to identify the different classification of defects (primary and secondary). This study focuses on defects such as Broken, Dried Cherry,

907 Floater, Full Black, Full Sour, Fungus Damage, and Insect Damage. The dataset will
 908 include at least 500 images of good beans and a minimum of 200 images for each defect
 909 category. To expand the dataset and enhance model training, augmentation techniques such
 910 as scaling, rotation, and mirroring will be applied.

911 **5.3.1 Dataset Collection and Model Training**

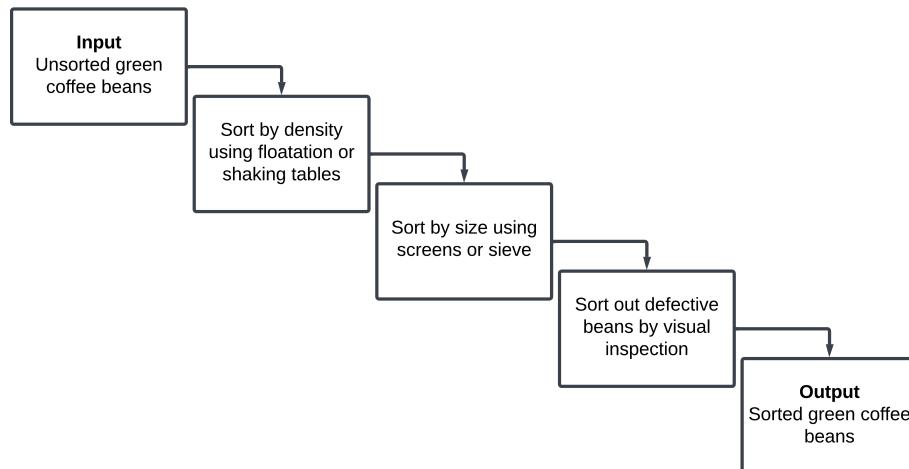

Fig. 5.6 Manual Sorting Process

912 The diagram in Figure 5.6 depicts the representation of the process of manual sorting of
 913 unsorted green coffee beans through a series of steps. First, the beans are sorted by density
 914 using methods such as floatation or shaking tables. This helps in separating the denser
 915 beans, usually pertaining to a more developed and higher quality bean. Then, the beans are
 916 sorted by size using screens and sieves with specific dimensions depending on the variety
 917 of the beans. After this, a thorough visual inspection is performed by the sorters to identify
 918 and remove the defective beans from the batch. To ensure consistency and accuracy, the
 919 group follows the Specialty Coffee Association of America (SCAA) Standards Defect

920 Handbook, which provide documentation and guidelines for identifying and classifying
921 defective beans. Finally, the process results in the output of sorted green coffee beans,
922 ready for further processing or sale. To ensure the dataset reflects real-world conditions, the
923 group acquired Arabica green coffee beans from Davao. These beans were manually sorted
924 to properly classify defective characteristics before capturing images for dataset creation.
925 This step was crucial for improving the efficiency of batch image capture and ensuring
926 accurate model training, making the system more applicable to Philippine coffee producers.

927 **5.3.2 Utilization of Open-Source Database**

928 To establish a foundation for the system's model, the group initially referenced an open-
929 source dataset from Kaggle. This dataset provides an original 500x500px images of Arabica
930 green coffee beans categorize as defective or good. This dataset also provided insights into
931 how individual beans were captured, including factors such as lighting, camera positioning,
932 focus, and resolution. By analyzing the dataset, the group gained a better understanding
933 of how to achieve a high-quality data collection, ensuring that the collected dataset would
934 contribute to high model accuracy when it is fed into the system.

935

5.3.3 First Iteration of Dataset Collection

Fig. 5.7 First Iteration of Data Collection Setup

De La Salle University

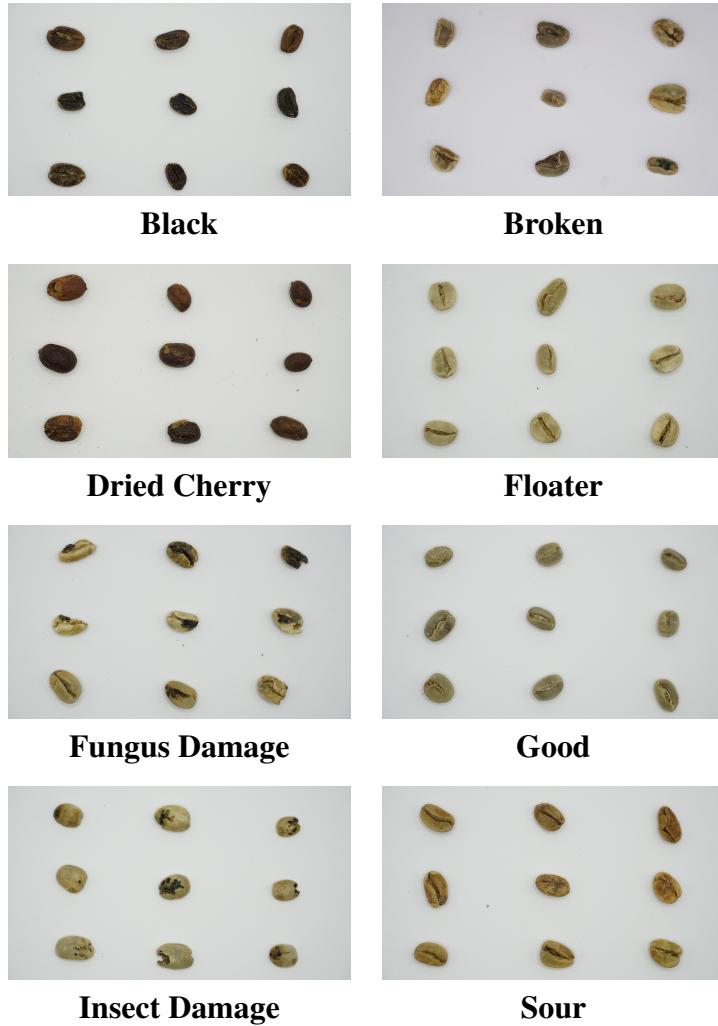

Fig. 5.8 Sample Images from the First Iteration of Dataset Collection

936 The first iteration of data collection utilized a Sony A6300 camera with its Kit Lens, set
937 at 1/200 Shutter Speed, 1000 ISO, and a Distance of 50mm. The beans were captured in
938 batches of nine, carefully arranged within the camera's field of view following the rule of
939 thirds. The rule of thirds is a photographic composition principle where an image is divided
940 into a 3x3 grid, creating nine equal grid lines to create balance to the photo. By aligning

941 the coffee beans with the rule of thirds, the group ensured a structured and even distribution
942 of the beans within the frame. This setup also made it easier to automate the cropping
943 process, as the predefined positions of the beans allowed a Python script to accurately
944 extract individual images.

945 **5.3.4 Second Iteration of Dataset Collection**

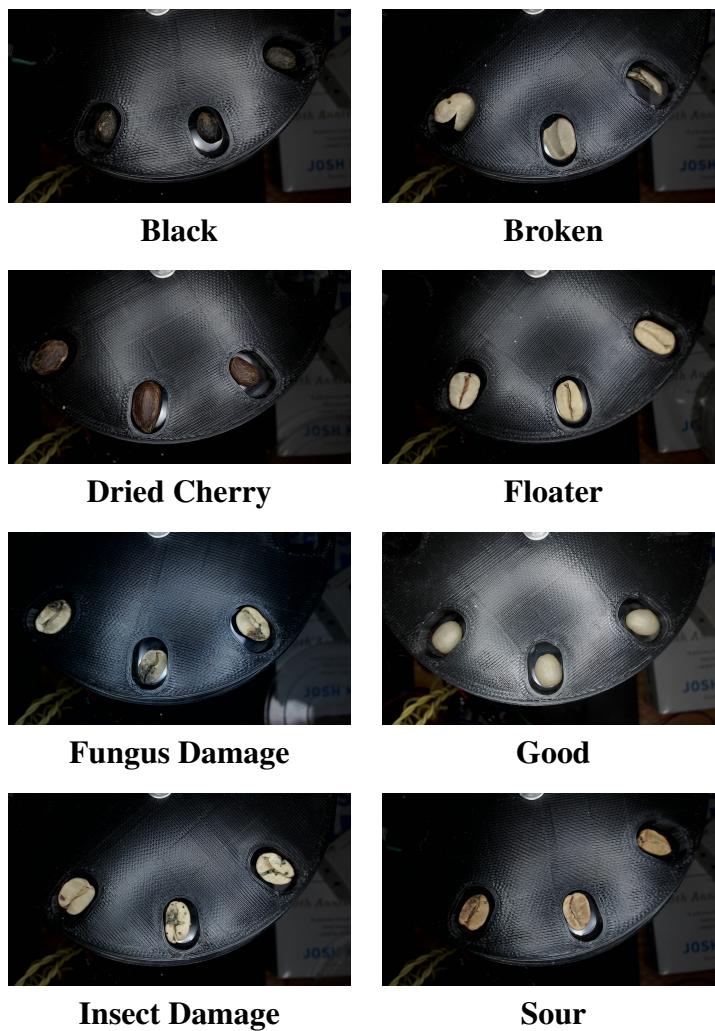

Fig. 5.9 Sample Images from the Second Iteration of Dataset Collection

946 The second iteration focused on real-world implementation, using the system's built-in
947 webcam to capture images directly from the inspection tray. This setup represents the
948 ideal condition, as it replicates the actual environment where the model will operate. The
949 images captured in this iteration directly reflect what the system will process in a practical
950 application, allowing for better generalization and real-time adaptability.

951 **5.4 Dataset Preprocessing**

952 **5.4.1 Dataset Splitting**

953 The dataset is divided into train, validation, and test sets in a 70-20-10 ratio. The training
954 dataset will be used for model learning, which allows it to identify patterns in the image.
955 The validation set is used to assess the model's performance and fine-tune the parameters
956 of the model during training. This is an iterative process wherein the model learns from
957 the training data and is then evaluated on and fine-tuned on the validation dataset. Finally,
958 the test set is used for evaluating the model's final performance, assessing its ability to
959 generalize to new data.

960 **5.4.2 Image Annotation**

961 Roboflow Annotate was used to label images of coffee beans. The platform was used for
962 two separate datasets: one for the detection model, the other for the classification model.
963 In the detection dataset, bounding boxes were drawn around individual coffee beans and
964 labeled accordingly. For the classification dataset, the trained detection model was used
965 to crop individual coffee beans from the raw dataset, which were then categorized into the

966 eight different classifications. Roboflow was chosen for its ability to store datasets in the
967 cloud and its support for different annotation formats, such as COCO and YOLO, ensuring
968 compatibility with different deep learning models during experimentation.

969 **5.4.3 Dataset Augmentation Techniques**

970 Data augmentation techniques were applied using Roboflow's tools to improve the model
971 generalization. Different augmentations such as rotation, flipping, blur, brightness and
972 contrast adjustment, and noise were used to simulate variations, which helps prevent
973 overfitting and improve the model's ability to identify defects in different lighting conditions
974 and orientations.

975 **5.5 Density Analysis**

976 **5.5.1 Density Estimation**

977 To estimate the volume of the bean through computer vision, bounding boxes are imple-
978 mented to first determine the area to be used for the volume estimation. Using the bounding
979 boxes to determine a pixel value for the green coffee bean, this will be used to scale the
980 image gathered from pixels to their estimated length and width.

981 Through the estimated length and width gathered, this is compared to the actual length
982 and width of the green coffee bean to compare both parameters. Through this, it is possible
983 to estimate the volume of the green coffee bean through computer vision. The formula for
984 triaxial ellipsoid is used to determine the volume of the green coffee bean.

985 The total volume of the batch of beans was measured by the water displacement

986 technique, a commonly used method to measure the volume of solids that are irregularly
 987 shaped. The beans were fully immersed in a water-filled graduated cylinder, and the rise in
 988 water level was measured. The volume of water displaced is equivalent to the combined
 989 volume of the batch of beans, measured in cubic centimeters (cm^3).

990 Comparing the volume measured through water displacement and the volume gathered
 991 by computing for the volume using the triaxial ellipsoid volume formula, the volumes differ
 992 by -6.52% up to +6.67%, with most errors within the $\pm 5\%$. This indicates that the model
 993 used to determine the volume of the green coffee bean is consistent with the ground-truth
 994 measurements.

995 The overall weight of the beans was determined by a high-precision digital scale (at
 996 least to 0.001 g resolution). Both the mass and volume are known, and the batch density
 997 may be calculated through the use of the standard formula for density:

$$\text{Batch Density} = \frac{\text{Total Mass of Beans (g)}}{\text{Total Volume Displaced (cm}^3\text{)}}$$

998 Obtaining the volume through computer vision, and obtaining the weight of the bean
 999 through the precision scale, an estimated density is obtained that will be used to sort out
 1000 the less dense from the dense beans.

1001 5.5.2 Density Threshold Calibration

1002 Setting the threshold for bean density is crucial for the stage 2 sorting of the system, which
 1003 involves measuring the density of each bean. In order to set a threshold for density-based
 1004 classification, a calibration batch of Good quality coffee beans was chosen. The beans were
 1005 confirmed to be free of defects and representative of typical specialty-grade coffee by the

1006 farmer. The threshold density was calculated by determining the average density of this
1007 batch through direct measurements of mass and volume.

1008 The computed average density served as the threshold value in the system. During
1009 automated classification, individual bean density is calculated using estimated volume (from
1010 image analysis) and actual weight (from the precision scale via RS232 communication).
1011 Beans with a density lower than the threshold are classified as less dense, while those
1012 meeting or exceeding the threshold are considered dense, indicating higher quality.

1013 **5.6 Model Training**

1014 **5.6.1 Image Detection Models**

1015 The object detection model identifies and isolates the coffee beans from the background.
1016 For this task, different models were explored:

1017 **1. RF-DETR**

1018 A transformer-based object detection model that eliminates the need for anchor boxes,
1019 improving small object detection.

1020 **2. YOLOv11**

1021 A CNN-based YOLO variant that incorporates the C3k2 block, SPPF, and C2PSA
1022 components to enhance feature extraction and detection accuracy.

1023 **3. YOLOv12**

1024 The latest YOLO version and attention-centric model that integrates transformer-
1025 based components to enhance performance while maintaining real-time efficiency.

5.6.2 Image Classification Models

Following detection, each identified coffee bean was cropped and classified based on its defect type. The classification models used included:

1. EfficientNetV2

A convolutional neural network (CNN) designed for high efficiency and accuracy, balancing computational cost and performance.

2. YOLOv8

A lightweight yet highly accurate model that supports both object detection and classification, making it suitable for real-time applications.

3. YOLOv11

A classification-specific adaptation of YOLOv11, leveraging enhanced feature extraction techniques for defect recognition.

4. YOLOv12

A classification variant of YOLOv12, incorporating advanced attention mechanisms to improve accuracy.

5. Vision Transformer (ViT)

The Vision Transformer (ViT) processes images as sequences of tokens for classification [Dosovitskiy et al., 2021]. A learnable “class token” is added to the sequence to support classification. Through the attention mechanism, it captures dependencies between image tokens. The encoder is composed of repeated multi-head self-attention

1046 and feedforward layers, with self-attention computing weighted sums of sequence
1047 elements.

1048 **5.6.3 Bean Classification Logic**

1049 To ensure proper classification, conditions are set based on how the top and bottom-side of
1050 the beans are categorized. For a bean to be labeled Good, both sides need to be classified
1051 as such. Similarly, Dried Cherry requires both sides to be classified as such, since Black
1052 beans can resemble Dried Cherry on its outer side. Moreover, both sides must be classified
1053 as Fungus Damage to be considered as such. If one side is classified as Black and the other
1054 Dried Cherry, or both are Black, then it will be labeled as Black. The rest of the defect
1055 types are sufficient for single-side detection, as seen in Table 5.2.

TABLE 5.2 CLASSIFICATION ALGORITHM FOR COFFEE BEANS

Input(s):	
<i>top_class</i>	: classification result from top camera; $top_class \in \mathbb{Z}^+$
<i>bottom_class</i>	: classification result from bottom camera; $bottom_class \in \mathbb{Z}^+$
Output(s):	
<i>class</i>	: final bean classification (Good, Defective, or specific defect)

```

17: else
18:  class  $\Leftarrow$  "Defective"
19: end if
20: return class

```

5.6.4 Model Evaluation

Each trained model will be tested on the system, with a predetermined set of beans. The results from this test are analyzed by using a confusion matrix, providing a detailed breakdown of the model's performance for each category. The confusion matrix provides a way to interpret classification results by defining the following parameters:

- **True Positives (TP)** - The number of correctly classified instances for a specific defect type.

1063 • **False Positives (FP)** - The number of times a different category was incorrectly
 1064 classified as this defect type.

1065 • **True Negatives (TN)** - All correctly classified instances excluding the defect category
 1066 in question.

1067 • **False Negatives (FN)** - The number of times this defect type was classified as
 1068 something else.

1069 Through these parameters, key performance metrics such as accuracy, precision, recall,
 1070 and F1-score were computed to evaluate the system's performance in different classifica-
 1071 tions as shown below. This test will assist in determining what types of defects the system
 1072 correctly classifies and which types might need improvements in image preprocessing,
 1073 dataset expansion, or optimization of the machine learning model. The outcome will be
 1074 applied to optimize the sorting algorithm for minimal misclassifications to ensure greater
 1075 reliability in real-world defect detection.

1076 1. **Accuracy** measures overall correctness of the classification model

$$Accuracy = \frac{TP + TN}{TP + TN + FP + FN} \quad (5.1)$$

1077 2. **Precision** measures how many of the predicted positive classifications were actually
 1078 correct

$$Precision = \frac{TP}{TP + FP} \quad (5.2)$$

1079 3. **Recall** evaluates how well the model identifies actual positive cases

$$Recall = \frac{TP}{TP + FN} \quad (5.3)$$

1080 4. **F1-score** represents the harmonic mean of precision and recall

$$F1\text{-Score} = 2 \times \frac{Precision \times Recall}{Precision + Recall} \quad (5.4)$$

1081 **5.6.5 Model Benchmarking and Selection**

1082 A total of 5 models were trained and tested within the actual system to determine the
1083 most effective one. These models trained and evaluated include EfficientNetV2, YOLOv8,
1084 YOLOv11, YOLOv12, and ViT. Each model was assessed using the defined performance
1085 metrics and compared accordingly. The model with the highest overall performance will be
1086 selected for deployment in the system.

1087 **5.7 Hardware Development**

1088 The hardware elements of the system, two-stage automated coffee bean sorter, are devel-
1089 oped to provide effective and precise sorting using a mix of mechanical and electronic
1090 components. Each element is designed and tested to maximize the sorting process while
1091 providing system reliability.

1092

5.7.1 Screw Feeder

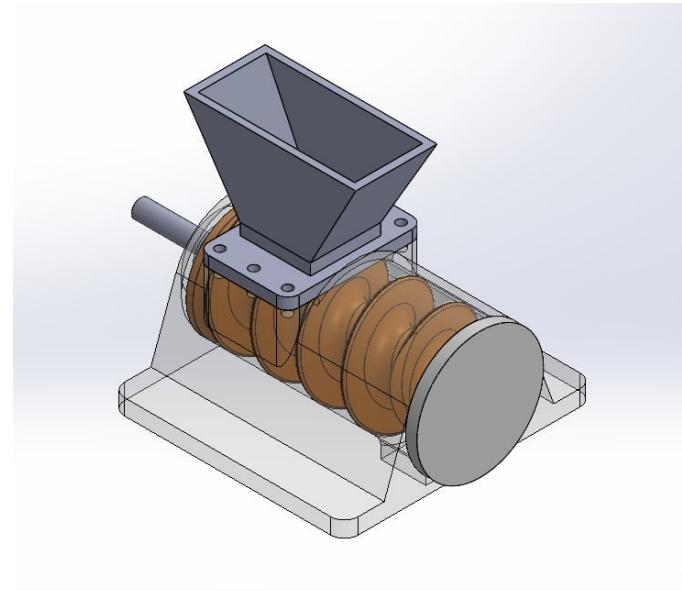

Fig. 5.10 Screw Feeder 3D Design

1093

Screw feeder is the most essential of the devices as it governs the beans of coffee moving into the system. It operates mostly to deliver the beans consistently in terms of volume and ensures they do not bundle up and fall into the system in heavy masses, causing beans build up on the rotating conveyor table. The feeder is driven by a 12V DC motor, and the rotation speed is regulated using PWM. Through a constant and controlled flow, the screw feeder avoids clogging and provides a consistent input into the inspection tray, enhancing overall system performance. Figure 5.10 shows the actual 3D model design of the screw feeder used in the system.

1101

5.7.2 Rotating Conveyor Table

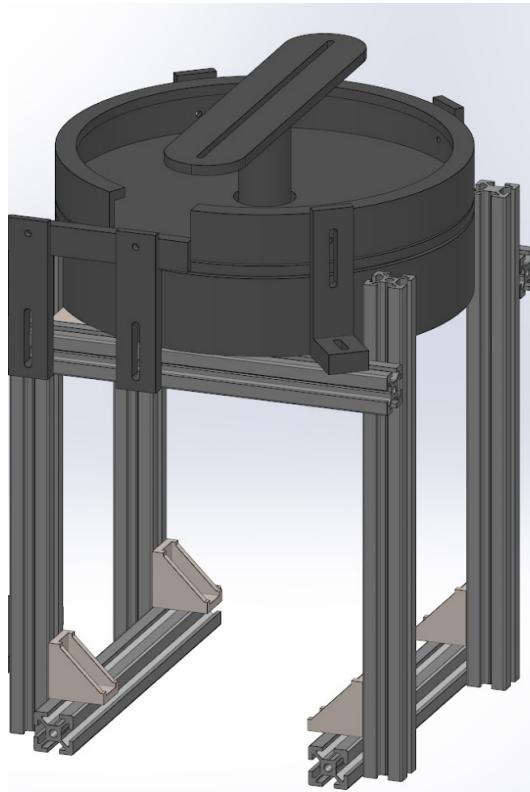

Fig. 5.11 Rotating Conveyor Table 3D Design

1102

The conveyor table, as shown in Figure 5.11, rotates to move the coffee beans from the feeding mechanism to the inspection tray. The table contains aluminum guides to linearly arrange the beans prior to dropping on the inspection tray. The conveyor is powered by a 12V DC motor, which offers consistent movement and regulated speed to avoid misalignment. By incorporating a turning mechanism, the conveyor guarantees beans are well oriented prior to inspection tray entry, minimizing classification errors due to faulty positioning.

1103

1104

1105

1106

1107

1108

Fig. 5.12 Rotating Conveyor Table with Aluminum Guides

1109 As shown in Figure 5.12, there are aluminum guides on the rotating conveyor table that
1110 ensures coffee beans to be linearly arranged. This linear arrangement of beans significantly
1111 helped the system to ensure that coffee beans are dropped onto the slide, which connects the
1112 conveyor table to the inspection try, in a one-by-one manner. In addition, the guides are also
1113 installed to keep the beans from accumulating in one area, which can cause the jamming of
1114 beans. The researchers tested the different motor speeds to observe the optimal settings that
1115 will not cause bean jamming and meet the minimum sorting speed of the system. However,
1116 while the aluminum guides are effective in arranging the beans linearly, it was hard to
1117 re-calibrate or adjust. Another problem was it was easy to be deformed whenever there

De La Salle University

1118 was jamming of beans. Upon printing the model, the bearing of the rotating mechanism
1119 was also not robust enough to hold the motor in higher RPM. There are instances where
1120 the gearing mechanism between the motor and the conveyor table experiences jamming,
1121 resulting in the conveyor table temporarily ceasing rotation. This issue typically arises from
1122 misalignment or friction within the gear interface, which hinders the smooth transfer of
1123 torque from the motor to the conveyor table.

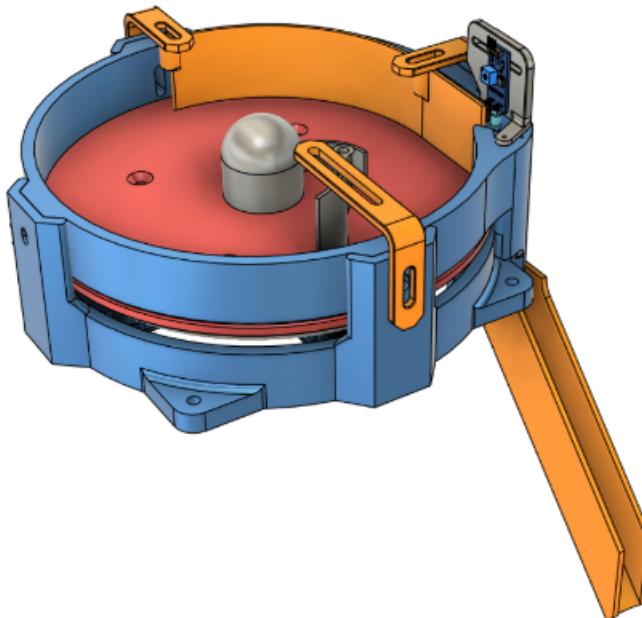

Fig. 5.13 Revised Rotating Conveyor Table

1124 Figure 5.13 shows the re-designed conveyor table. In this revision, calibration of the
1125 guides was easier since it can be moved by only loosening the screws. To avoid the issue
1126 caused by the misalignment within the gear of the previous rotating table mechanism, the
1127 researchers opted to revise the design. The new iteration of the rotating conveyor table
1128 was redesigned using a Lazy Susan bearing. In this modification, smoother rotation was

1129 observed.

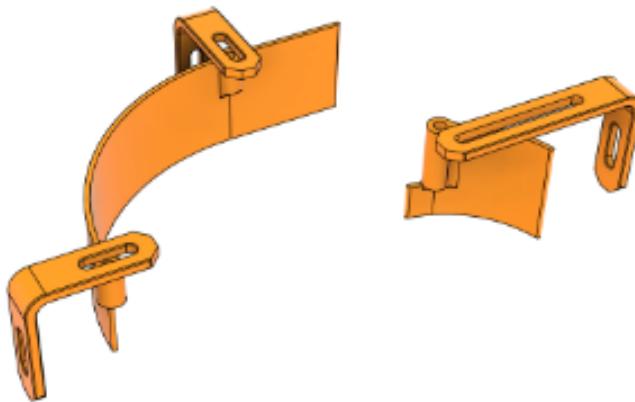

Fig. 5.14 3D Printed Guides

1130 In addition, the previously aluminum guides were replaced with 3D-printed guides that
1131 were screwed onto the table walls. The revised design allowed for easier calibration, as
1132 the guides could be repositioned simply by loosening the screws, enabling more precise
1133 alignment of beans.

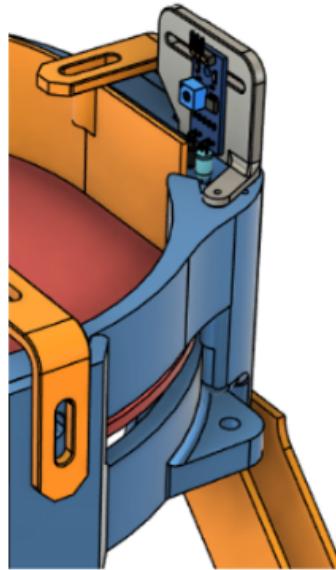

Fig. 5.15 IR Sensor Placement

Another point of improvement was the placement of the IR sensor, which was redesigned to be adjustable. This adjustability allowed faster calibration and ensured accurate detection of beans at the table's edge, further enhancing the system's reliability and consistency. Initially, the rotating conveyor table is set at a fixed and slow speed to ensure that coffee beans are dropped into the inspection tray one-by-one. However, at this rate, the time travel time of the first bean dropped from the center of the table is very long. Thus, the group decided to add an IR sensor at the edge of the rotating table as seen in Figure X. The sensor's responsibility is to detect if there is a bean at the edge. If there is no bean detected, the rotating table is set to a higher speed to expedite the process. On the other hand, if a bean is detected by the sensor, the rotation of the table is adjusted in such a way that it is able to drop the beans one-by-one onto the inspection tray. With this sensor integrated into the system, a higher speed can be set for the rotating table, minimizing the time travel of the beans from the center to the inspection tray, resulting in a faster sorting time for the

1147 first stage.

1148 **5.7.3 Stage 1: Defect Sorting (Machine Vision and Inspection**

1149 **Tray)**

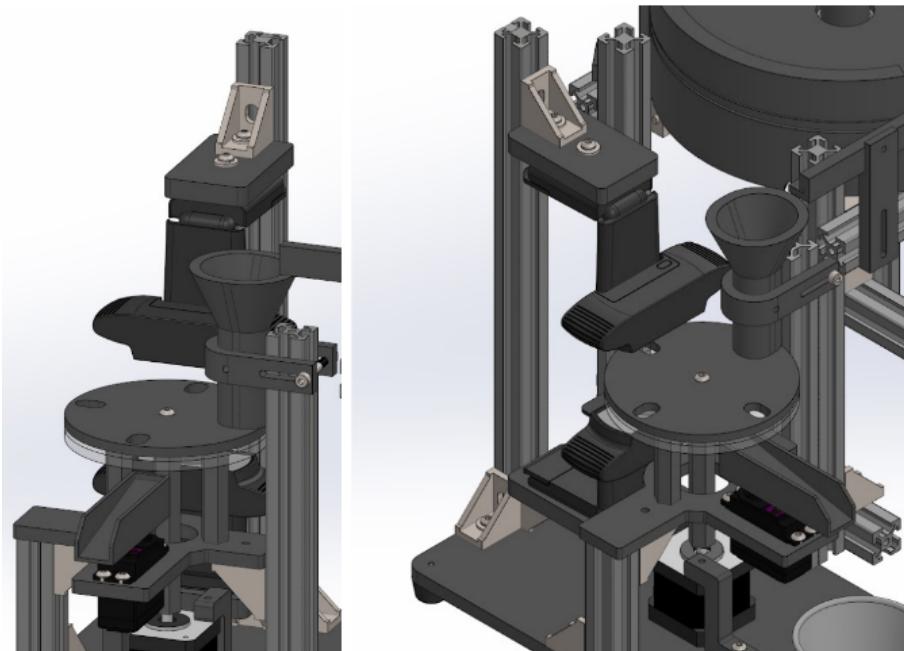

Fig. 5.16 Inspection Tray 3D Design

1150 The inspection tray is the main component for the first-stage sorting mechanism. The
1151 inspection tray is used to support beans in a stable and constrained position for a short
1152 time, enabling the camera to take high-resolution images without motion blur. The NEMA
1153 17 stepper motor drives the movement of the inspection tray, enabling accurate alignment
1154 with the vision system's image processing pipeline. The tray surface is created to reduce
1155 reflections and enhance contrast so that the camera can precisely detect defects like cracks,
1156 discoloration, or insect infestation. In addition, the surface is made of clear acrylic to allow

1157 a clear image for the camera positioned at the bottom of the tray. Lastly, a rotatable slider
1158 controlled by a 5V servo motor serves as the main segregator of the good beans from the
1159 defective beans.

1160 **5.7.4 Stage 2: Density Sorting (Precision Scale and Servo
1161 Mechanism)**

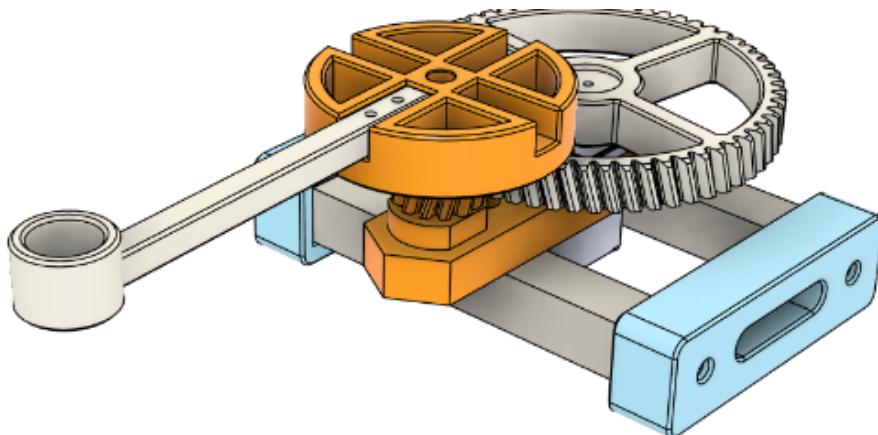

Fig. 5.17 Density Sorter Mechanism Design

1162 The density sorter is the second-stage sorting system, tasked with sorting coffee beans
1163 according to their measured density. This is achieved by initially measuring each bean's
1164 mass using a precision weighing scale and volume using the computer vision. After
1165 calculating the density, the system triggers a sorting system powered by a geared 5V
1166 servomotor, which sorts beans into various collection bins according to their classification.
1167 This sorting operation is such that high-density beans are kept separate from low-density
1168 beans. The density sorter's accuracy is verified by comparing the results of its classification
1169 to manual weighing measurements (ground truth data).

Fig. 5.18 Precision Scale

1170 The U.S. Solid Electronic Precision Balance (0.01g, 1200g capacity, RS232 port,
1171 AC/DC power) was selected for the density sorting mechanism because it is highly accurate,
1172 transmits data in real-time, and is well-calibrated. Its 0.01g precision guarantees accurate
1173 mass readings, which are critical to precise density calculations in sorting coffee beans.
1174 The RS232 port facilitates smooth integration with the microcontroller for automatic data
1175 processing and sorting decisions, minimizing manual errors. Its dual power source (AC
1176 and battery) also guarantees uninterrupted operation in different environments, making it a
1177 dependable and efficient part of the coffee bean sorting system.

5.8 Hardware and Software Integration

5.8.1 Serial Communication

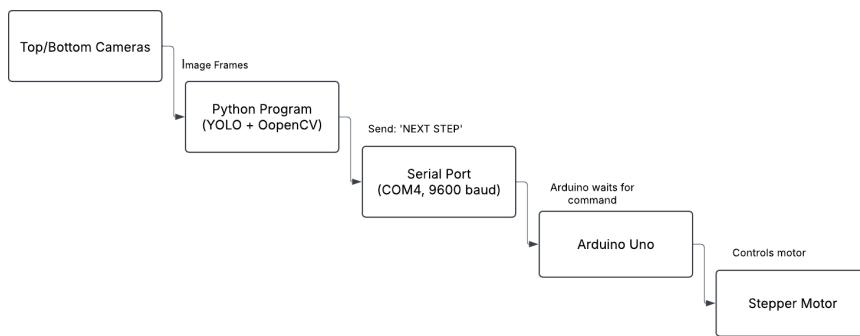

Fig. 5.19 Serial Communication Flow for Stage 1 Classification

The system is generally composed of hardware and software components. Hardware components are mainly responsible for collecting data from the coffee beans such as the camera and IR sensor, and the sorting mechanisms such as servo motors and stepper motors. On the other hand, the software components are the brain of the system which is mainly responsible for data processing such as image detection, defect classification of the beans, volume and density computation, and control of the mechanisms. Since the system has two major components, software and hardware, they should be integrated together for the system to be as effective. Thus, serial communication was utilized to integrate the hardware and software components of the system. Serial communication is a significant component in the system as it serves as the communication medium of the hardware and software. It enables real-time coordination between the software (YOLO-based image detection, classification, and density computation) and the hardware (running in Arduino microcontrollers). The said communication is established with the use of a USB serial

1193 interface using the pyserial library in Python. In addition, this is configured at a baud rate
1194 of 9600.

1195 The system, specifically at the inspection tray mechanism where the YOLO detection
1196 and classification is implemented, has a function move_stepper() responsible for sending
1197 the command from the Python code to the Arduino microcontroller. When the Arduino
1198 receive this command, it executes motor movement that allows the stepper motor to move
1199 at a certain angle that allows the camera to capture the bean. This function is crucial for the
1200 system as this is how each bean in the inspection tray is fed to the image processing side of
1201 the system. This movement rotates the mechanism holding the coffee beans, positioning the
1202 next bean beneath the top and bottom cameras for inspection. After the motor completes
1203 the movement, the Arduino will send back a message to the program running Python,
1204 signalling that the bean is ready for image capture and further processing. In addition, the
1205 Python script is continuously or constantly waiting for the Arduino's message through the
1206 arduino.readline() function, ensuring seamless communication and faster processing.

1207

5.8.2 Recommended Standard 232 (RS-232)

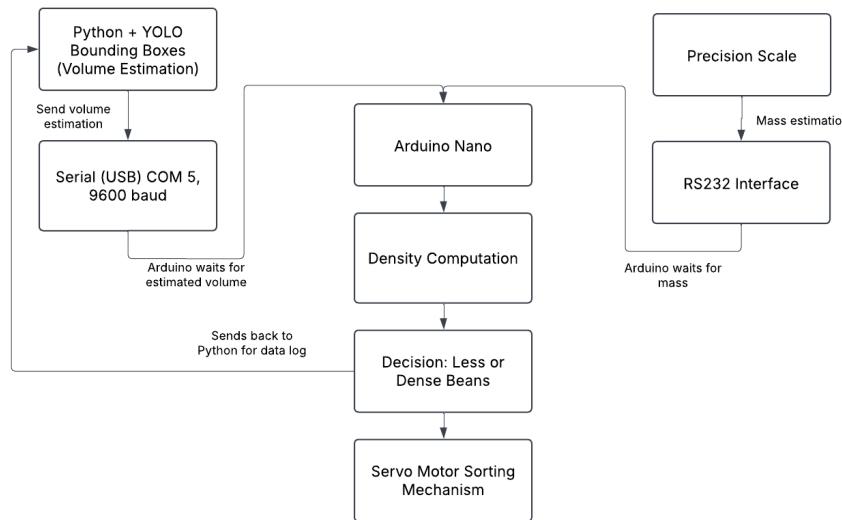

Fig. 5.20 Precision Scale Integration with RS232 for Stage 2 Classification

1208

The stage 2 classification is mainly composed of the sorting mechanism itself, and the precision scale to measure the mass of each bean. The bounding boxes from the stage 1 classification are used to estimate each bean's volume. Additionally, the beans depth is also estimated through the IR sensor placed in the rotating conveyor table. With these measurements, the volume of each bean, the volume can be calculated using the Tri-axial Ellipsoid's volume formula.

1214

The stage 2 classification, density-based sorting, is implemented using a combination of RS232 and USB serial communication. In this stage, each bean that has been classified as 'Good' from stage 1 is again sorted based on the density. The RS232's main responsibility is to simultaneously record and pass the values to the Arduino Nano to compute the density. Subsequently, the data from the computations are the deciding factor whether to sort out

1220 **5.9 Prototype Setup**

1221 **5.9.1 Actual Setup**

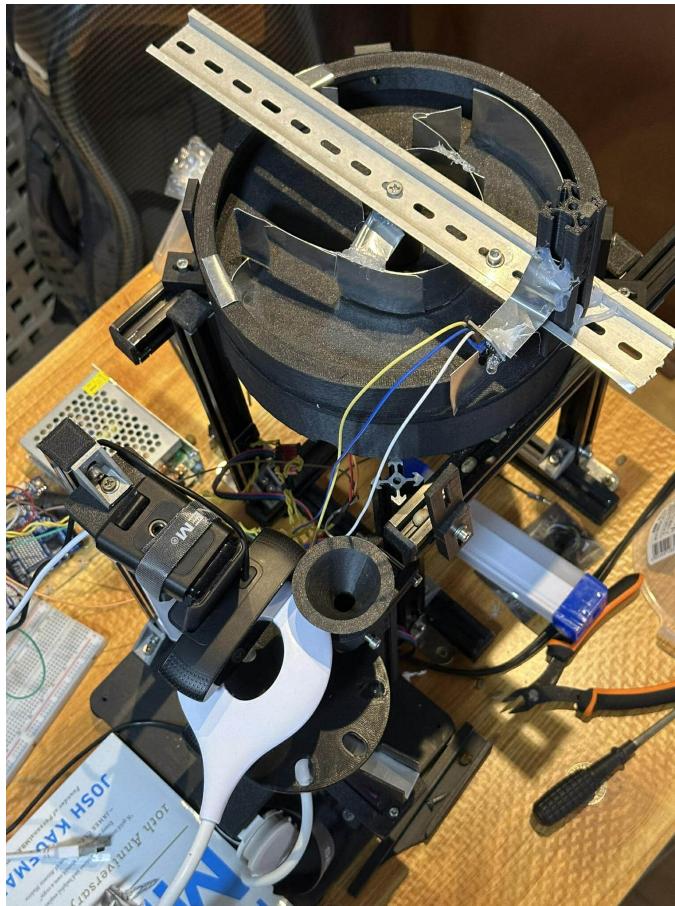

Fig. 5.21 Actual System Setup (1st Iteration)

Fig. 5.22 Actual System Setup (2nd Iteration)

Physical integration of the automatic coffee bean sorter system comprises various integrated parts with the purpose of enabling effective, accurate, and methodical sorting in terms of visual defects as well as density categorization. The system involves integration of mechanical, electronic, and computer vision technologies for optimizing sorting. To begin the process, coffee beans are added to a revolving conveyor table, which is the main mechanism of transport used for feeding the beans into the inspection system. The conveyor features aluminum guides positioned strategically along it to ensure linear alignment of the beans as they travel. Linear alignment is required to avoid overlap and misclassification, since individual processing by the machine vision system is necessary for each bean. Once the beans travel further along the conveyor, they are conveyed onto the inspection tray. There, they are viewed in multiple perspectives by two high-definition cameras. A two-camera imaging process ensures improved defect detection by providing a full, thorough evaluation of the surface, shape, and texture of the bean. The images are then processed with a deep learning-based classification algorithm that classifies each bean as either defective or good according to predefined defect types like black beans, dried cherries, fungus damage,

1237 insect damage, sour beans, floaters, and broken beans. After classification, the system
1238 triggers the defect sorting mechanism, which physically takes out defective beans from
1239 the processing line. The mechanism includes a servo motor-powered sorting slide, which
1240 diverts defective beans into a distinct collection bin. Good beans that are classified are
1241 taken to the second level of sorting, which is density-based classification. At the density-
1242 based sorting level, good beans are weighed individually with a high-precision electronic
1243 balance. The U.S. Solid Electronic Precision Balance (0.01g, RS232) is embedded within
1244 the system to accurately weigh the mass of each bean. According to the calculation of
1245 density, beans are automatically sorted into corresponding collection bins using a second
1246 sorting mechanism regulated by a NEMA 17 stepper motor.

5.9.2 Lighting Setup for Inspection Tray

1247 Lighting has a key importance in the image-based detection and classification system,
1248 specifically for the inspection tray. For the model to be more accurate and precise in
1249 classifying good and defective beans, correct lighting is important such that details like
1250 surface texture, color difference, and defects are properly rendered by the imaging system.
1251 Asymmetrical, unsteady, or low-quality lighting can create shadows, reflections, or over-
1252 exposure, all of which lower the quality of input images and thus decrease the accuracy
1253 of object detection and classification models like YOLO. To improve the consistency and
1254 definition of images taken during inspection, the lighting arrangement above the inspection
1255 tray was refined incrementally throughout development. The refinements were intended to
1256 maximize the illumination conditions for both the top and bottom camera modules.
1257

Fig. 5.23 First Iteration of Lighting Setup

1258 Figure 5.23 shows the initial lighting setup that the researchers implemented on the
1259 system. The initial lighting arrangement was based on a single top-mounted LED lighting.
1260 Although the arrangement was more than bright enough for the top camera, it introduced
1261 random shadows and highlights onto the bottom camera. As a result, only one side of the
1262 bean is accurately inspected. These random elements impacted the model's performance
1263 in detecting bean contours and separating surface flaws, particularly for dark beans or
1264 reflective-surface beans.

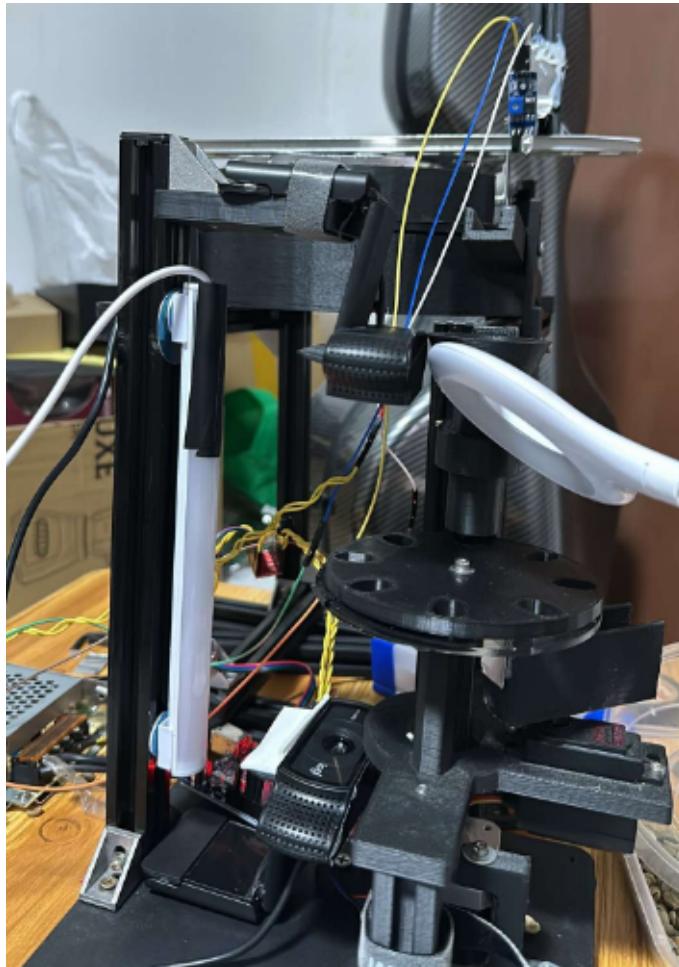

Fig. 5.24 Second Iteration of Lighting Setup

1265 For the second iteration of the lighting setup, the researchers decided to add another
1266 LED strip lighting at the side of the inspection tray, while keeping the LED lighting
1267 mounted at the top. This provided good lighting for both top and bottom cameras. However,
1268 the view of the bottom camera is still a bit dark.

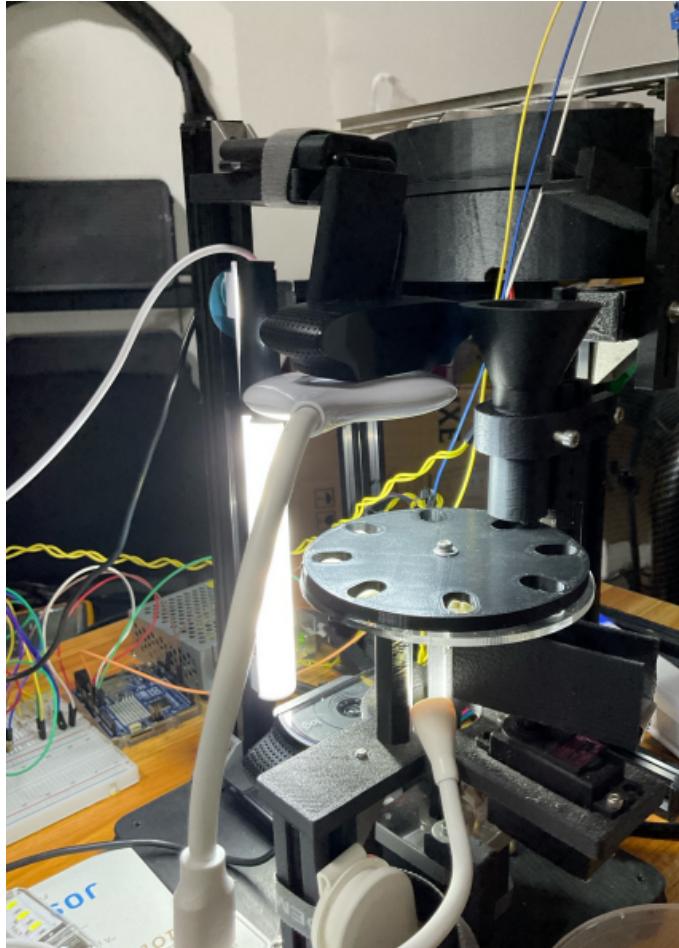

Fig. 5.25 Final Iteration of Lighting Setup

1269 To ensure that both camera views have sufficient lighting and avoid shadows, the
1270 researchers decided to use a total of three LED lights. One is a small ring light placed
1271 exactly above the inspection tray. Another LED light is a strip light placed at the side of
1272 the inspection tray to improve lighting at the side of each bean. Another small LED light
1273 is placed under the inspection tray to ensure that the bottom camera has enough lighting.
1274 Electrical tape was applied to the side of the acrylic plate to block excess lighting, thereby
1275 optimizing the lighting setup of the system.

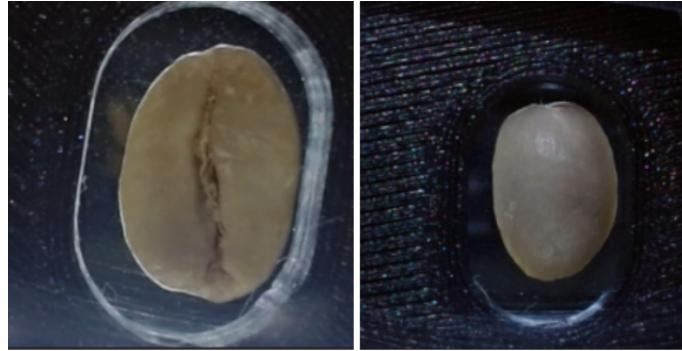

Fig. 5.26 Top and Bottom View of the Cameras

5.9.3 System Operation

The system operation follows a sequential process to ensure the effective sorting of green coffee beans (GCBs) based on its classification and density. The automated system consists of two primary stages: 1st Stage which is the machine vision-based classification and 2nd stage which is the density-based sorting.

The process begins in the inputting of unsorted GCBs (Contains good and defective beans) into the screw feeder, which regulates the controlled and consistent delivery of the beans into the rotary conveyor table. The conveyor table is designed with aluminum guides to ensure a linearized formation of the beans to mitigate jamming. This also ensures a controlled movement of beans, ensuring that they drop onto the inspection tray one at a time. As the bean goes towards the edge of the conveyor table, the IR sensors detect the beans and stops the rotation to ensure the one-by-one inspection of the beans, this also prevents clogging, and jamming once the beans are dropped into the inspection tray.

The first phase involves machine-vision classification. Once the GCBs reach the inspection tray, each bean is analyzed one-by-one using a machine vision system consisting

De La Salle University

1291 of top and bottom cameras. The system captures high-resolution images of the bean and
1292 processes the data to determine which classification it belongs. If the bean is identified as
1293 defective, a signal is sent to the servo motor, which redirects the bean into the defective bin
1294 for disposal, if the bean is classified as good, it then proceeds to the second phase of the
1295 system

1296 The second stage involves density-based sorting, where each GCB's weight is measured
1297 using a precision scale, while its volume is determined by the bounding boxes from the
1298 first stage. These bounding boxes were used to estimate the dimensions of the beans and
1299 used the Ellipsoid volume formula for volume estimation.

1300 The sorting mechanism activates, directing beans into designated collection bins based
1301 on their density. High-density beans, often associated with specialty-grade quality, are
1302 separated from low-density, commercial-grade, or defective beans.

1303 **5.10 Prototype Testing**

1304 **5.10.1 Sorting Speed**

TABLE 5.3 SORTING SPEED TESTING TABLE

Test Condition	Conveyor Table Speed (RPM)	Inspection Tray Speed (RPM)	Sorting Speed (Beans per Minute)
100% Good Beans			
75% Good, 25% Defective Beans			
50% Good, 50% Defective Beans			
25% Good, 75% Defective Beans			
100% Defective Beans			

1305 The sorting speed of the system will be determined by conducting at least five trials.
 1306 Each trial will be exactly conducted for one minute. The number of beans sorted out within
 1307 the time frame are considered as the sorting speed in beans per minute. Then, the average
 1308 sorting speed from the five trials is computed. In each trial session, controlled variables
 1309 such as motor speed of the inspection tray and rotating conveyor table are varied to observe
 1310 the optimal setting for the system, ensuring that there are no beans jamming in the tray and
 1311 fast enough to meet the minimum sorting speed. Table 5.3 shows the different conditions
 1312 for each trial to ensure that the sorting speed across different type of beans are considered.

**1313 5.10.2 Defect Sorting Accuracy**

1314 To measure the system's performance on defect sorting, two separate tests were performed.
1315 The first test was performed to measure the system's accuracy on classifying the seven
1316 defect types including good beans. On the other hand, a second test was conducted to
1317 measure the system's reliability on sorting out defective beans from good beans. In this
1318 test, there are only two classifications – defective beans and good beans.

De La Salle University

Black - 30 Beans

Broken - 30 Beans

Dried Cherry - 30 Beans

Floater - 30 Beans

Fungus Damage - 30 Beans

Good - 150 Beans

Insect Damage - 30 Beans

Sour - 30 Beans

Fig. 5.27 Per-Classification Test Dataset

1319 Table 5.27 shows the actual test dataset used in the first test. This test was conducted
1320 using the top two performing models after training. Based on the 70-20-10 training,
1321 validation, test split, the researchers gathered 30 beans for each defect type, and 150 for

1322 good beans. The test consists of 5 trials with the same test set. Each trial was divided
 1323 into 8 parts, corresponding to each classification. In this test, if one of the cameras detects
 1324 the specific defect type being tested, it is considered as correctly classified. However, for
 1325 good beans, both cameras should be able to classify it as good to be considered as a correct
 1326 classification.

**100% Good****75% Good, 25% Defects****50% Good, 50% Defects****25% Good, 75% Defects****100% Defects**

Fig. 5.28 Good vs. Defective Test Dataset

1327 The defect sorting accuracy by feeding 100 beans on each trial. For testing its accuracy
 1328 for detecting good beans and defective beans, five trials are conducted containing 100 beans
 1329 of good beans for the first trial, 75 good and 25 defects for the second trial, 50 good and 50

1330 defects for the third trial, 25 good and 75 defects for the fourth trial, and 100 defects for the
 1331 last trial. With these, the number of correctly classified and misclassified beans are logged
 1332 into the system to compute for accuracy.

TABLE 5.4 DATASET DISTRIBUTION FOR OVERALL TESTING

Bean Classification	Bean Count
Good	150
Black	30
Broken	30
Dried Cherry	30
Floater	30
Fungus Damage	30
Insect Damage	30
Sour	30
Total Beans	360

1333 Lastly, to assess the overall accuracy and reliability of the first stage, machine vision-
 1334 based defect classification, a trial consisting of a predefined dataset of 360 coffee beans
 1335 was conducted. The good classification consists of 150 beans, while each defect, such as
 1336 black, dried cherry, fungus, insect damage, sour, floater, and broken beans, consists of 30
 1337 beans as shown in Table 5.4.

5.10.3 Density Sorting Accuracy

1338 To assess the accuracy of the mechanism, it will rely on measuring the accuracy and the
 1339 reliability of the density sorting mechanism in sorting out the dense beans to the less dense
 1340 beans. To successfully determine the accuracy of the system, the basis will be the scale,
 1341 where the system should be able to sort the dense beans to the less dense bean in relation
 1342

1343 to the detected weight in the scale. A successful system should be able to sort with an
1344 accuracy of 85%.

1345

6.1 Description of the New Custom Dataset

TABLE 6.2 CLASS DISTRIBUTION SUMMARY

Class Name	Image Count
Black	391
Broken	259
Dried Cherry	359
Floater	260
Fungus Damage	255
Good	1513
Insect Damage	370
Sour	404
Total	3811

1348

Table 6.2 presents the dataset's class distribution after adjustments. The image counts for each category were increased such that the minimum is above 200 and a minimum of 1500 images for Good beans; for instance, Black has 391 images and Good has 1513 images. The table confirms a total of 3811 images distributed across the eight classes, ensuring a balanced dataset that maintains diversity while meeting the minimum requirements.

TABLE 6.3 DATASET SPLIT SUMMARY

Split	Percentage	Image Count	Augmentation
Train	70%	2668	Original training images are augmented three times
Validation	20%	762	Non-augmented
Test	10%	381	Non-augmented

1353

Table 6.3 outlines the dataset split into training, validation, and test sets. The training set comprises 70% (2,668 images), while the validation and test sets account for 20% (762

1354

1355 images) and 10% (381 images) respectively, with the training images later augmented 3×
1356 per image.

1357 **6.2 Performance of Classification Models on Cus- 1358 tom Dataset**

1359 Five different classification models, such as EfficientNet, YOLOv8, YOLOv11, YOLOv12,
1360 and ViT were benchmarked to determine the most optimal model to be used for the system.
1361 Each model was trained using a custom dataset manually gathered by the researchers. In
1362 addition, augmentations such as rotation, flip, blur and noise, were applied.

1363

6.2.1 EfficientNetV2S

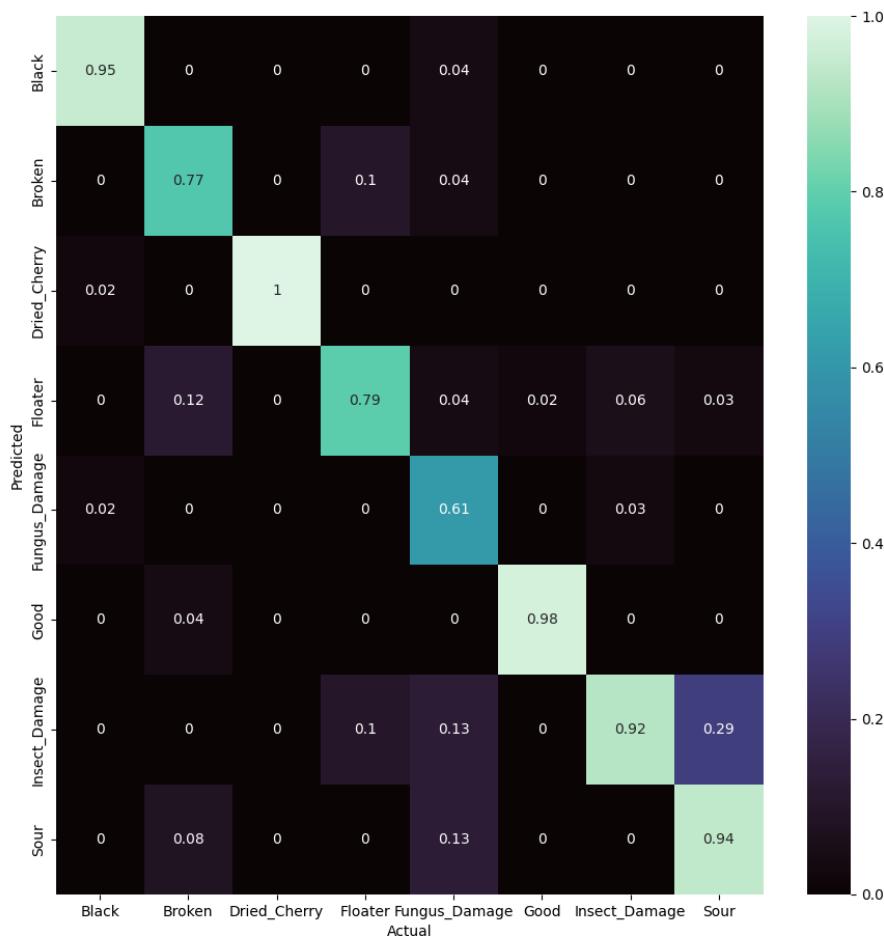

Fig. 6.1 Normalized Confusion Matrix for EfficientNetV2S on Test Dataset

1364

EfficientNetV2 maintained competitive recognition for Black (95%), Dried Cherry (100%),

1365

and Good (98%), but defect categories performed poorly. Fungus Damage was the weakest

1366

across all models (61%), with extensive misclassification into Insect Damage and Sour.

- 1367 Broken scored only 77%, spilling into Floater and Sour. Sour beans had 94% recognition
1368 but with 29% misclassified as Insect Damage. While good at separating distinct classes,
1369 this model struggles most with subtle defect patterns.

1370

6.2.2 YOLOv8

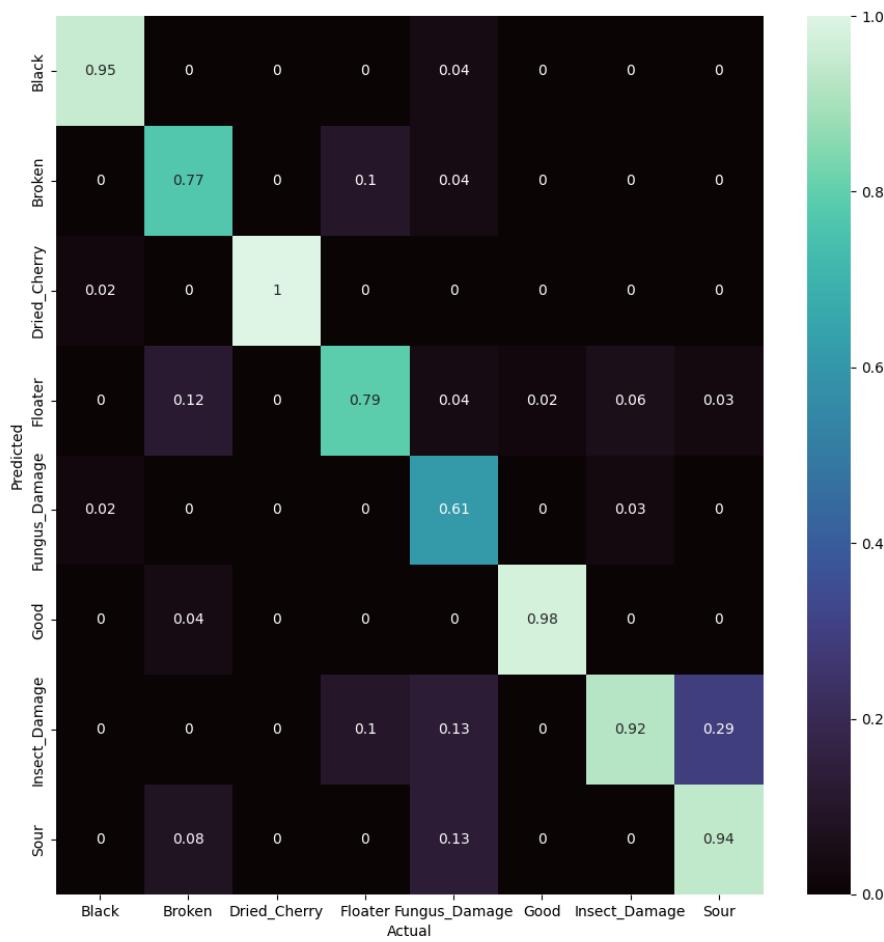

Fig. 6.2 Normalized Confusion Matrix for YOLOv8 on Test Dataset

1371

YOLOv8 achieved strong recognition for Black (98%), Dried Cherry (100%), Good (99%),

1372

and Sour (100%). However, it struggled with Fungus Damage (61%), where a large share of

1373

samples were confused with Broken and Insect Damage. Broken was moderately accurate

1374 (85%) but often mistaken as Floater. Insect Damage was fairly strong (94%) yet confused
1375 back into Fungus Damage. The model excels at highly distinctive classes but struggles with
1376 visually similar defects.

1377

6.2.3 YOLOv11-cls

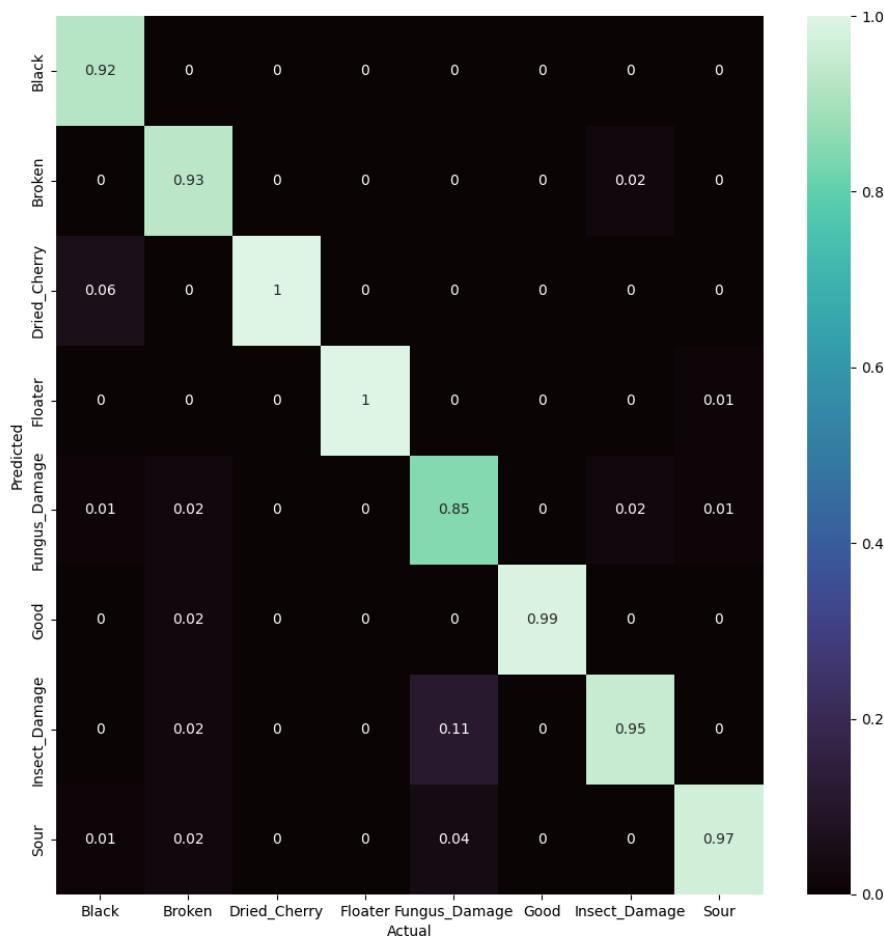

Fig. 6.3 Normalized Confusion Matrix for YOLOv11 on Test Dataset

1378

YOLOv11 improved class balance compared to YOLOv8, with near-perfect results in Dried

1379

Cherry, Floater, and Good (all 99–100%). Broken rose to 93%, reducing cross-class errors.

1380

Fungus Damage remained difficult at 85%, misclassified into Broken, Insect Damage, and

- 1381 Sour. Insect Damage achieved 95% but still leaked into Fungus Damage. This model
1382 demonstrates more stability in defect-prone categories while maintaining high precision in
1383 separable classes.

1384

6.2.4 YOLOv12-cls

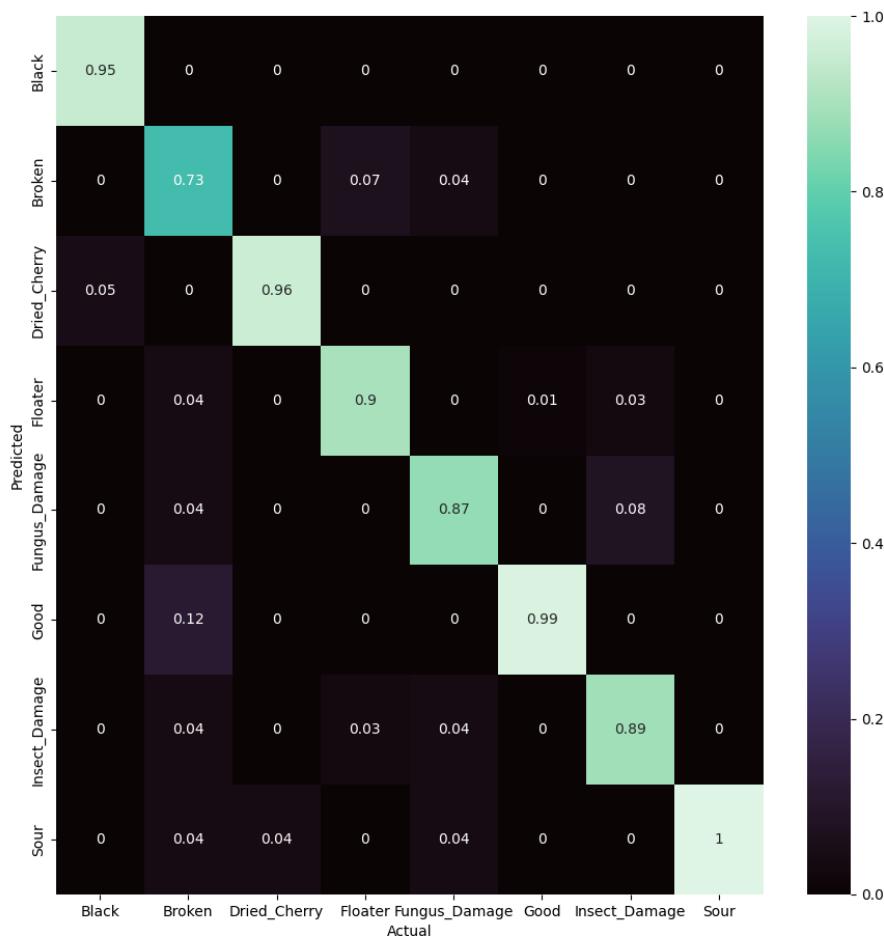

Fig. 6.4 Normalized Confusion Matrix for YOLOv12 on Test Dataset

1385

YOLOv12 presented mixed performance: Dried Cherry (96%), Good (99%), and Sour

1386

(100%) stayed strong, but Broken collapsed to 73%, with heavy confusion into Floater and

1387

Fungus Damage. Fungus Damage was moderate (87%) but overlapped with Insect Damage

1388 (8%). Insect Damage itself dropped to 89%, reflecting this reciprocal confusion. Compared
1389 to YOLOv11, YOLOv12 was less stable on defect-heavy categories, showing variability
1390 despite strong results in clearer classes.

1391

6.2.5 Vision Transformer (ViT)

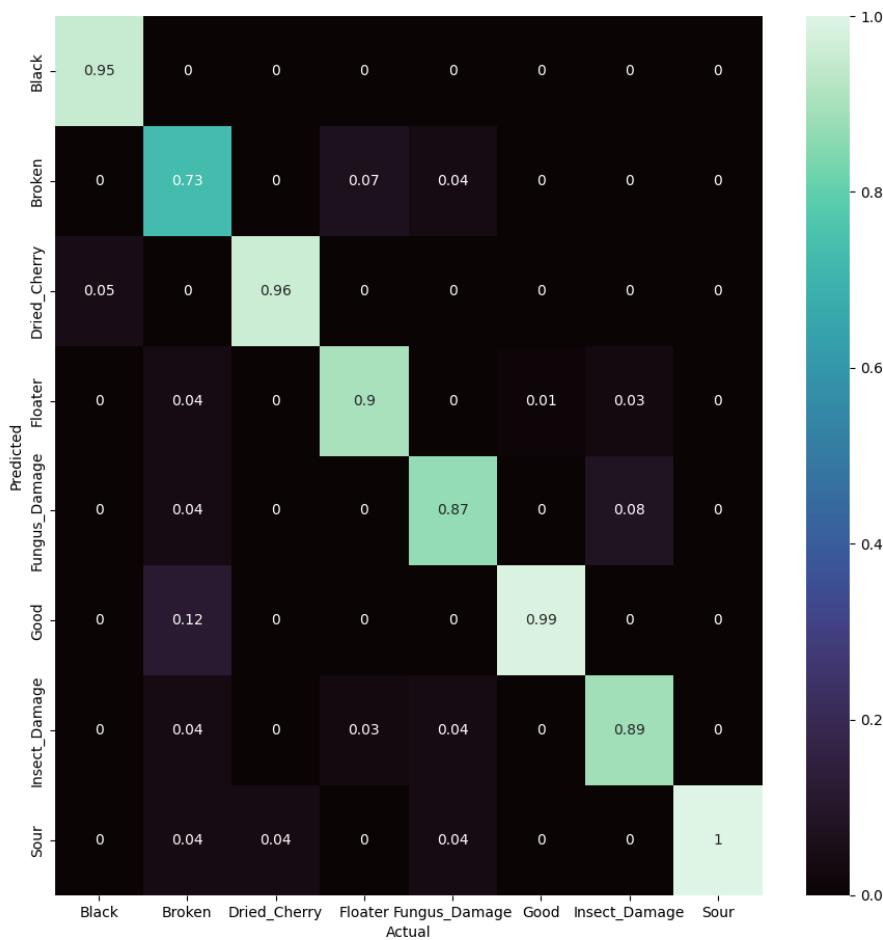

Fig. 6.5 Normalized Confusion Matrix for ViT on Test Dataset

1392

The ViT model delivered the most consistent results overall. Black and Dried Cherry were perfectly classified (100%), while Good, Insect Damage, and Sour exceeded 97%. Broken

1393

1394 reached 92%, with minor leakage into Floater and Fungus Damage. Floater held 93%
 1395 accuracy, though with 7% misclassified as Broken. Fungus Damage was stronger than
 1396 in other models (87%) but still overlapped with Insect Damage (9%). ViT demonstrates
 1397 the best balance, minimizing confusion between defects while maintaining near-perfect
 1398 performance in distinct classes.

TABLE 6.4 MODEL PERFORMANCE COMPARISON

Model	Precision (%)	Recall (%)	F1-Score (%)	Accuracy (%)
EfficientNetV2	87.90	87.08	87.08	98.02
YOLOv8	91.14	90.41	90.55	98.65
YOLOv11	92.97	93.71	93.19	98.90
YOLOv12	91.97	91.20	91.47	98.64
ViT	95.85	95.76	95.77	99.35

1399 Table 6.4 shows that EfficientNetV2 had the weakest performance, with the lowest
 1400 precision, recall, F1-score, and accuracy. The YOLO models improved on these results,
 1401 with YOLOv11 performing slightly better than YOLOv8 and YOLOv12. Among all, ViT
 1402 achieved the highest scores across all metrics, showing the best ability to classify the test
 1403 dataset with minimal errors. Overall, performance increases from EfficientNetV2 to YOLO,
 1404 with ViT giving the most reliable results.

1405 **6.3 Actual Performance of Classification Models in 1406 the System**

1407 Among the 5 models, YOLOv12 and ViT achieved the highest performance. Thus, these
 1408 two models were tested and deployed on the actual system. To measure the performance of

1409 the two models, two types of tests were conducted. The first test was conducted to measure
1410 the models' performances on classifying different defect types, and the other test was
1411 dedicated to measuring the models' performances when classifying Good and Defective
1412 beans . The first test set was composed of 30 beans per defect and 150 good beans, with
1413 a total of 360 beans. For each trial, the testing was divided into 8, corresponding to each
1414 classification. True Positives (TP) are the number of samples from a defect type that were
1415 correctly classified as that defect. False Negatives (FN) are the number of samples from a
1416 defect type that were misclassified as something else. Per-class accuracy was computed
1417 for each trial and the average accuracy across all trials. On the other hand, the second test
1418 was composed of 100 beans per trial, wherein each trial had a varying distribution of good
1419 and defective beans. In this test, TP is the number of good beans classified as good, TN is
1420 the number of defective beans classified as defects, FP is the number of defective beans
1421 misclassified as good, and FN is the number of good beans misclassified as defects.

6. Results and Discussions

Fig. 6.6 Actual Performance of YOLOv12 in the System (Per-Classification)

Table 6.6 represents the actual performance of YOLOv12 when deployed into the system. Across five trials, the results showed that the model achieved promising accuracy in certain categories like Insect Damage and Sour, where an accuracy of 100% in some trials were recorded. Most importantly, the model's performance on Good beans classification was highly reliable achieving 96-97% across the different trials. However, it was observed that the model struggled with other categories such as Black, Broken, Fungus Damage, and Dried Cherry, achieving an accuracy score of only around 70-80%. The overall accuracy of YOLOv12 across all the trials was 86.4%, which is already reliable especially for detecting Good vs Defective beans.

6. Results and Discussions

De La Salle University

Trial	Defect Type	Number of Samples	TP	FN	Accuracy	Average Accuracy Per Trial

Overall Accuracy Across All Trials						96.17%

Fig. 6.7 Actual Performance of ViT in the System (Per-Classification)

1431 In Table 6.7, the performance of the Vision Transformer (ViT) model across all five trials
 1432 were presented. The recorded data shows that ViT was more consistent than the YOLOv12,
 1433 achieving very high accuracy scores in classifying Black, Dried Cherry, Floater, Sour, and
 1434 Good beans. It was observed that the model even achieved perfect accuracies on these
 1435 classifications on some trials. On the other hand, the model's performance on classifying
 1436 Broken beans was slightly lower but still reliable, achieving an accuracy between 86-90

1437 Table 6.5 presents the performance of YOLOv12 on classifying good and defective
 1438 beans under varying test conditions. Compared to the model's per-classification perfor-
 1439 mance, the results demonstrated higher accuracy when classifying good and defective
 1440 beans. The model achieved an average accuracy of 94.8% across all trials with varying test

TABLE 6.5 ACTUAL PERFORMANCE OF YOLOv12 IN THE SYSTEM (GOOD VS. DEFECT)

Test Condition	TP	TN	FP	FN	Accuracy (%)
100% Good Beans	89	0	0	11	89
75% Good, 25% Defective	71	24	1	4	95
50% Good, 50% Defective	49	49	1	1	98
25% Good, 75% Defective	23	72	3	2	95
100% Defective Beans	0	97	3	0	97
Average Accuracy					94.8

1441 conditions. These findings indicate that YOLOv12 can be a reliable model when simply
 1442 sorting between the two classifications.

TABLE 6.7 ACTUAL PERFORMANCE OF ViT IN THE SYSTEM (GOOD VS. DEFECT)

Test Condition	TP	TN	FP	FN	Accuracy (%)
100% Good Beans	100	0	0	0	100
75% Good, 25% Defective	72	24	1	3	96
50% Good, 50% Defective	48	50	0	2	98
25% Good, 75% Defective	23	75	0	2	98
100% Defective Beans	0	98	2	0	98
Average Accuracy					98

1443 On the other hand, Table 6.7 presents the data on the performance of ViT model under
 1444 varying proportions of good and defective beans. The model achieved an average accuracy
 1445 of 98% across all five trials, which was similar to its per-classification accuracy. Thus,
 1446 showing reliability and consistency on its accuracy on both per-classification testing (defect
 1447 types) and binary testing (good and defect).

1448

6.4 Sorting Speed

TABLE 6.9 SORTING SPEED TEST CONDITIONS

Test Condition	Conveyor (RPM)	Inspection (RPM)	Sorting (Beans/min)
100% Good Beans	175	343	22
80% Good, 20% Defective	175	343	22
70% Good, 30% Defective	175	343	21
50% Good, 50% Defective	175	343	24
100% Defective Beans	175	343	22

1449

Table 6.9 presents the prototype system's sorting speed performance under different test conditions. The conveyor table speed and inspection tray motor speed is constant at 175 RPM and 343 RPM, respectively, to ensure consistency in all trials. The sorting speed, expressed in beans per minute, indicates the system's capacity to recognize and process coffee beans. The outcomes indicate that the system maintained a steady average sorting rate of 22 beans per minute in most conditions, such as 100% good beans, 80:20, and 100% defective beans. The minimal drop to 21 beans per minute under the 70% good and 30% defective condition could be due to the long wait time for the beans to fall onto the inspection tray. On the other hand, the peak sorting rate of 24 beans per minute under the 50:50 condition indicates that the system's classification and actuations were synchronized. Overall, the prototype proves to have stable and consistent sorting throughput. The results confirm that the system can work at a steady speed appropriate for small-scale processing operations without degradation in performance by the number of defective beans.

Trial	Category	Samples	Correct	Accuracy	Overall Accuracy
1	Dense	53	50	94.34%	92.06%
	Less Dense	10	8	80.00%	
2	Dense	53	49	92.45%	90.48%
	Less Dense	10	8	80.00%	
3	Dense	53	48	90.57%	90.48%
	Less Dense	10	9	90.00%	
4	Dense	53	49	92.45%	90.48%
	Less Dense	10	8	80.00%	
5	Dense	53	50	94.34%	90.48%
	Less Dense	10	7	70.00%	
Average Accuracy					90.89%

Fig. 6.8 Actual Density Sorting Performance

1462 Table 6.8 presents the results of five trials evaluating the density sorting mechanism.
 1463 The system consistently classified dense beans with high accuracy, ranging from 90.57% to
 1464 94.34%, showing that the sorter was generally reliable in distinguishing beans with higher
 1465 density. In contrast, the classification of less dense beans fluctuated more significantly,
 1466 with accuracies between 70.00% and 90.00%, indicating that this category posed greater
 1467 difficulty for the system. Overall accuracies across the trials remained relatively stable,
 1468 ranging from 90.48% to 92.06% with an average accuracy of 90.89%, which demonstrates
 1469 consistent sorting performance but also highlights that occasional misclassifications pre-
 1470 vented the system from reaching perfect accuracy. These findings suggest that while the
 1471 sorter is effective in identifying dense beans, improvements may be needed in refining the
 1472 sensitivity of the system to reliably classify less dense beans.

1473

Chapter 7

1474

CONCLUSIONS, RECOMMENDATIONS, AND FUTURE DIRECTIVES

1475

1476 7.1 Concluding Remarks

1477 The study was able to present the design, development, and actual implementation of a two-
1478 staged automated green coffee bean sorting system, utilizing computer vision and embedded
1479 systems. The design is composed of a rotating conveyor table, a dual-camera inspection
1480 tray, defect sorting mechanism, and density-based sorting mechanism. In addition, five
1481 deep learning-based classification models such as EfficientNetV2, YOLOv8, YOLOv11,
1482 YOLOv12, and ViT were benchmarked. These models were deployed and tested into the
1483 actual defect sorting system with a test dataset of 20 beans per classification, where the
1484 ViT achieved the highest accuracy of 98%. In terms of the sorting speed, the system was
1485 tested in 5 trials, where it achieved an average sorting speed of 22.2 beans per minute. The
1486 system was tested under varying quality distributions and maintained consistent sorting
1487 speeds, thereby confirming its practical viability. Overall, the results indicate that the
1488 integration of deep learning and embedded automation offers a robust and scalable solution
1489 for post-harvest coffee bean quality assessment.

1490 7.2 Contributions

1491 This study contributed to the coffee industry in the Philippines by introducing a two-
1492 stage automated coffee bean sorter that enhances coffee quality assessment by segregating
1493 defective beans and sorting dense and less-dense beans. This system integrates machine
1494 vision and density-based sorting, ensuring that high-quality, dense beans and potential
1495 specialty-grade coffee are selected for further processing. This system can support the
1496 Philippine coffee industry's efforts to enhance product quality and meet global specialty
1497 coffee standards to improve market competitiveness.

1498 7.3 Recommendations

1499 The following are the recommendations for further study of this design:

- 1500 • Optimize the density-based sorting mechanism
- 1501 • Improvement of system portability by reducing the overall size and weight of the
- 1502 system

1503 7.4 Future Prospects

1504 This study offers a building block for future innovation in intelligent post-harvest coffee
1505 processing. A potential extension is combining cloud-based data storage and analytics for
1506 traceability at the batch level and remote monitoring. Another would be the deployment of
1507 light inference models on microcontroller units (MCUs) to facilitate real-time, on-device
1508 computation, thus minimizing system latency and increasing portability. Additional re-
1509 search might also investigate the use of unsupervised or semi-supervised learning methods
1510 to identify new or infrequent defects without depending solely on labeled data. Commer-
1511 cially, the system can be scaled to process greater volumes using modular conveyor lines
1512 and parallel sorting stations. These developments would greatly benefit coffee producers
1513 by providing consistent, efficient, and objective bean quality assessment.

RESEARCH ETHICS CLEARANCE FORM¹ For Thesis Proposals

Names of Student Researcher(s):

Dela Cruz, Juan Z.

SAMPLE ONLY

College: Gokongwei College of Engineering

Department: Electronics and Communications Engineering

Course: PhD-ECE

Expected Duration of the Project: from: April 2015 to: April 2017

Ethical considerations

None

(The [Ethics Checklists](#) may be used as guides in determining areas for ethical concern/consideration)

To the best of my knowledge, the ethical issues listed above have been addressed in the research.

Dr. Francisco D. Baltasar

Name and Signature of Adviser/Mentor:

Date: April 8, 2017

Noted by:

Dr. Rafael W. Sison

Name and Signature of the Department Chairperson:

Date: April 8, 2017

¹ The same form can be used for the reports of completed projects. The appropriate heading need only be used.

Appendix B ANSWERS TO QUESTIONS TO THIS THESIS

De La Salle University

- 1629 **B1 How important is the problem to practice?**
- 1630 **B2 How will you know if the solution/s that you will achieve would be better than existing ones?**
- 1631
- 1632 **B2.1 How will you measure the improvement/s?**
- 1633 **B2.1.1 What is/are your basis/bases for the improvement/s?**
- 1634 **B2.1.2 Why did you choose that/those basis/bases?**
- 1635 **B2.1.3 How significant are your measure/s of the improvement/s?**
- 1636 **B3 What is the difference of the solution/s from existing ones?**
- 1637
- 1638 **B3.1 How is it different from previous and existing ones?**
- 1639 **B4 What are the assumptions made (that are behind for your proposed solution to work)?**
- 1640
- 1641 **B4.1 Will your proposed solution/s be sensitive to these assumptions?**
- 1642
- 1643 **B4.2 Can your proposed solution/s be applied to more general cases when some assumptions are eliminated? If so, how?**
- 1644
- 1645 **B5 What is the necessity of your approach / proposed solution/s?**
- 1646
- 1647 **B5.1 What will be the limits of applicability of your proposed solution/s?**
- 1648
- 1649 **B5.2 What will be the message of the proposed solution to technical people? How about to non-technical managers and business people?**
- 1650
- 1651
- 1652 **B6 How will you know if your proposed solution/s is/are correct?**
- 1653
- 1654 **B6.1 Will your results warrant the level of mathematics used (i.e., will the end justify the means)?**
- 1655

Appendix E USAGE EXAMPLES

1685

1686 The user is expected to have a working knowledge of L^AT_EX. A good introduction is
 1687 in [?]. Its latest version can be accessed at <http://www.ctan.org/tex-archive/info/lshort>.

1688 E1 Equations

1689 The following examples show how to typeset equations in L^AT_EX. This section also shows
 1690 examples of the use of `\gls{ }` commands in conjunction with the items that are in
 1691 the `notation.tex` file. **Please make sure that the entries in `notation.tex` are**
 1692 **those that are referenced in the L^AT_EX document files used by this Thesis. Please**
 1693 **comment out unused notations and be careful with the commas and brackets in**
 1694 **`notation.tex` .**

1695 In (E.1), the output signal $y(t)$ is the result of the convolution of the input signal $x(t)$
 1696 and the impulse response $h(t)$.

$$y(t) = h(t) * x(t) = \int_{-\infty}^{+\infty} h(t - \tau) x(\tau) d\tau \quad (\text{E.1})$$

1697 Other example equations are as follows.

$$\begin{bmatrix} V_1 \\ I_1 \end{bmatrix} = \begin{bmatrix} A & B \\ C & D \end{bmatrix} \begin{bmatrix} V_2 \\ I_2 \end{bmatrix} \quad (\text{E.2})$$

$$\frac{1}{2} < \left\lfloor \mod \left(\left\lfloor \frac{y}{17} \right\rfloor 2^{-17|x| - \mod(\lfloor y \rfloor, 17)}, 2 \right) \right\rfloor, \quad (\text{E.3})$$

$$|\zeta(x)^3 \zeta(x+iy)^4 \zeta(x+2iy)| = \exp \sum_{n,p} \frac{3 + 4 \cos(ny \log p) + \cos(2ny \log p)}{np^{nx}} \geq 1 \quad (\text{E.4})$$

De La Salle University

1698

The verbatim L^AT_EX code of Sec. E1 is in List. E.1.

Listing E.1: Sample L^AT_EX code for equations and notations usage

```

1 The following examples show how to typeset equations in \LaTeX. This
2 section also shows examples of the use of \verb| \gls{ } | commands
3 in conjunction with the items that are in the \verb| notation.tex | file.
4 \textbf{Please make sure that the entries in} \verb| notation.tex | file
5 \textbf{are those that are referenced in the} \verb| \LaTeX | document files used by this \verb| documentType |. Please comment out
6 unused notations and be careful with the commas and brackets in} \verb| \verb| notation.tex | .
7
8 In \verb|\eqref{eq:conv}|, the output signal \gls{not:output_sigt} is the
9 result of the convolution of the input signal \gls{not:input_sigt}
10 and the impulse response \gls{not:ir}.
11
12 \begin{eqnarray}
13 y\left( t \right) = h\left( t \right) * x\left( t \right)=\int_{-\infty}^{+\infty}h\left( t-\tau \right)x\left( \tau \right) \\
14 \mathrm{d}\tau
15 \label{eq:conv}
16 \end{eqnarray}
17
18 Other example equations are as follows.
19
20 \begin{eqnarray}
21 \left[ \frac{V_1}{I_1} \right] =
22 \begin{bmatrix}
23 A & B \\
24 C & D
25 \end{bmatrix}
26 \label{eq:ABCD}
27 \end{eqnarray}
28
29 \begin{eqnarray}
30 \frac{1}{2} < \lfloor \mathrm{mod}\left(\lfloor \lfloor \frac{y}{17} \rfloor \rfloor \cdot 2^{17}, 17 \right) \rfloor, 2 \rfloor
31 \end{eqnarray}
32
33 \begin{eqnarray}
34 |\zeta(x)^3 \zeta(x + iy)^4 \zeta(x + 2iy)| = \\
35 \exp\sum_{n,p} \frac{3 + 4 \cos(n \log p) + \cos(2ny \log p)}{np^{nx}} \geq 1
36 \end{eqnarray}

```

	E2 Notations												
1699													
1700	In order to use the standardized notation, the user is highly suggested to see the ISO 80000-2 standard [?].												
1701													
1702	See https://en.wikipedia.org/wiki/Help:Displaying_a_formula and https://en.wikipedia.org/wiki/List_of_mathematical_symbols for L ^A T _E X maths and other notations, respectively.												
1703													
1704	The following were taken from <code>isomath-test.tex</code> .												
1705	E2.1 Math alphabets												
1706	If there are other symbols in place of Greek letters in a math alphabet, it uses T1 or OT1 font encoding instead of OML.												
1707													
	<table> <tr> <td>mathnormal</td> <td>$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, 0, 1, 9$</td> </tr> <tr> <td>mathit</td> <td>$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$</td> </tr> <tr> <td>mathrm</td> <td>$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$</td> </tr> <tr> <td>mathbf</td> <td>$\mathbf{A}, \mathbf{B}, \mathbf{\Gamma}, \mathbf{\Delta}, \mathbf{\Theta}, \mathbf{\Lambda}, \mathbf{\Xi}, \mathbf{\Pi}, \mathbf{\Sigma}, \mathbf{\Phi}, \mathbf{\Psi}, \mathbf{\Omega}, ff, fi, \mathbf{\beta}, ^!, \mathbf{v}, \mathbf{w}, 0, 1, 9$</td> </tr> <tr> <td>mathsf</td> <td>$\mathsf{A}, \mathsf{B}, \mathsf{\Gamma}, \mathsf{\Delta}, \mathsf{\Theta}, \mathsf{\Lambda}, \mathsf{\Xi}, \mathsf{\Pi}, \mathsf{\Sigma}, \mathsf{\Phi}, \mathsf{\Psi}, \mathsf{\Omega}, ff, fi, \mathsf{\beta}, ^!, \mathsf{v}, \mathsf{w}, 0, 1, 9$</td> </tr> <tr> <td>mathtt</td> <td>$\mathtt{A}, \mathtt{B}, \mathtt{\Gamma}, \mathtt{\Delta}, \mathtt{\Theta}, \mathtt{\Lambda}, \mathtt{\Xi}, \mathtt{\Pi}, \mathtt{\Sigma}, \mathtt{\Phi}, \mathtt{\Psi}, \mathtt{\Omega}, \mathtt{ff}, \mathtt{fi}, \mathtt{\beta}, ^!, \mathtt{v}, \mathtt{w}, 0, 1, 9$</td> </tr> </table>	mathnormal	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, 0, 1, 9$	mathit	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$	mathrm	$A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$	mathbf	$\mathbf{A}, \mathbf{B}, \mathbf{\Gamma}, \mathbf{\Delta}, \mathbf{\Theta}, \mathbf{\Lambda}, \mathbf{\Xi}, \mathbf{\Pi}, \mathbf{\Sigma}, \mathbf{\Phi}, \mathbf{\Psi}, \mathbf{\Omega}, ff, fi, \mathbf{\beta}, ^!, \mathbf{v}, \mathbf{w}, 0, 1, 9$	mathsf	$\mathsf{A}, \mathsf{B}, \mathsf{\Gamma}, \mathsf{\Delta}, \mathsf{\Theta}, \mathsf{\Lambda}, \mathsf{\Xi}, \mathsf{\Pi}, \mathsf{\Sigma}, \mathsf{\Phi}, \mathsf{\Psi}, \mathsf{\Omega}, ff, fi, \mathsf{\beta}, ^!, \mathsf{v}, \mathsf{w}, 0, 1, 9$	mathtt	$\mathtt{A}, \mathtt{B}, \mathtt{\Gamma}, \mathtt{\Delta}, \mathtt{\Theta}, \mathtt{\Lambda}, \mathtt{\Xi}, \mathtt{\Pi}, \mathtt{\Sigma}, \mathtt{\Phi}, \mathtt{\Psi}, \mathtt{\Omega}, \mathtt{ff}, \mathtt{fi}, \mathtt{\beta}, ^!, \mathtt{v}, \mathtt{w}, 0, 1, 9$

1709	Do the math alphabets match?												
1710	$ax\alpha\omega ax\alpha\omega ax\alpha\omega \quad TC\Theta\Gamma TC\Theta\Gamma TC\Theta\Gamma$												
1711	E2.2 Vector symbols												
1712	Alphabetic symbols for vectors are boldface italic, $\lambda = e_1 \cdot a$, while numeric ones (e.g.												
1713	the zero vector) are bold upright, $a + 0 = a$.												
1714	E2.3 Matrix symbols												
1715	Symbols for matrices are boldface italic, too: ¹ $A = E \cdot A$.												

¹However, matrix symbols are usually capital letters whereas vectors are small ones. Exceptions are physical quantities like the force vector F or the electrical field E .

1716 **E2.4 Tensor symbols**

1717 Symbols for tensors are sans-serif bold italic,

$$\boldsymbol{\alpha} = \mathbf{e} \cdot \mathbf{a} \iff \alpha_{ijl} = e_{ijk} \cdot a_{kl}.$$

1718 The permittivity tensor describes the coupling of electric field and displacement:

$$\mathbf{D} = \epsilon_0 \epsilon_r \mathbf{E}$$

	E2.5 Bold math version
1719	
1720	The “bold” math version is selected with the commands <code>\boldmath</code> or <code>\mathversion{bold}</code>
	mathnormal $A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, 0, 1, 9$
	mathit $A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$
	mathrm $A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$
	mathbf $A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$
	mathsf $A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$
	mathtt $A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, ff, fi, \beta, ^!, v, w, 0, 1, 9$
1721	New alphabets bold-italic, sans-serif-italic, and sans-serif-bold-italic.
	mathbfit $A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, 0, 1, 9$
	mathsfit $A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, 0, 1, 9$
	mathsfbfit $A, B, \Gamma, \Delta, \Theta, \Lambda, \Xi, \Pi, \Sigma, \Phi, \Psi, \Omega, \alpha, \beta, \pi, \nu, \omega, v, w, 0, 1, 9$
1722	Do the math alphabets match?
1723	$ax\alpha\omega ax\alpha\omega ax\alpha\omega \quad TC\Theta\Gamma TC\Theta\Gamma TC\Theta\Gamma$
1724	E2.5.1 Vector symbols
1725	Alphabetic symbols for vectors are boldface italic, $\lambda = e_1 \cdot a$, while numeric ones (e.g.
1726	the zero vector) are bold upright, $a + 0 = a$.
1727	E2.5.2 Matrix symbols
1728	Symbols for matrices are boldface italic, too: ² $\Lambda = E \cdot A$.
1729	E2.5.3 Tensor symbols
1730	Symbols for tensors are sans-serif bold italic,
	$\alpha = e \cdot a \iff \alpha_{ijl} = e_{ijk} \cdot a_{kl}.$
1731	The permittivity tensor describes the coupling of electric field and displacement:
	$D = \epsilon_0 \epsilon_r E$

²However, matrix symbols are usually capital letters whereas vectors are small ones. Exceptions are physical quantities like the force vector F or the electrical field E .

```

E3 Abbreviation

This section shows examples of the use of L^AT_EX commands in conjunction with the items that are in the `abbreviation.tex` and in the `glossary.tex` files. Please see List. E.3. **To lessen the L^AT_EX parsing time, it is suggested that you use `\acr{}` only for the first occurrence of the word to be abbreviated.**

Again please see List. E.3. Here is an example of first use: alternating current (ac). Next use: ac. Full: alternating current (ac). Here's an acronym referenced using `\acr`: hyper-text markup language (html). And here it is again: html. If you are used to the `glossaries` package, note the difference in using `\gls`: hyper-text markup language (html). And again (no difference): hyper-text markup language (html). For plural use `\glsp`. Here are some more entries:

- extensible markup language (xml) and cascading style sheet (css).
- Next use: xml and css.
- Full form: extensible markup language (xml) and cascading style sheet (css).
- Reset again.
- Start with a capital. Hyper-text markup language (html).
- Next: Html. Full: Hyper-text markup language (html).
- Prefer capitals? Extensible markup language (XML). Next: XML. Full: extensible markup language (XML).
- Prefer small-caps? Cascading style sheet (css). Next: CSS. Full: cascading style sheet (CSS).
- Resetting all acronyms.
- Here are the acronyms again:
- Hyper-text markup language (HTML), extensible markup language (XML) and cascading style sheet (CSS).
- Next use: HTML, XML and CSS.
- Full form: Hyper-text markup language (HTML), extensible markup language (XML) and cascading style sheet (CSS).

- 1920 • Provide your own link text: style sheet.

1921 The verbatim L^AT_EX code of Sec. E3 is in List. E.3.

Listing E.3: Sample L^AT_EX code for abbreviations usage

```

1 Again please see List.~\ref{lst:abbrv}. Here is an example of first use:
  \acr{ac}. Next use: \acr{ac}. Full: \gls{ac}. Here's an acronym
  referenced using \verb|\acr|: \acr{html}. And here it is again: \acr{html}.
  If you are used to the \texttt{glossaries} package, note
  the difference in using \verb|\gls|: \gls{html}. And again (no
  difference): \gls{html}. Here are some more entries:
2
3 \begin{itemize}
4
5   \item \acr{xml} and \acr{css}.
6
7   \item Next use: \acr{xml} and \acr{css}.
8
9   \item Full form: \gls{xml} and \gls{css}.
10
11  \item Reset again. \glsresetall{abbreviation}
12
13  \item Start with a capital. \Acr{html}.
14
15  \item Next: \Acr{html}. Full: \Gls{html}.
16
17  \item Prefer capitals? \renewcommand{\acronymfont}[1]{\
      \MakeTextUppercase{#1}} \Acr{xml}. Next: \acr{xml}. Full: \gls{xml}
      }.
18
19  \item Prefer small-caps? \renewcommand{\acronymfont}[1]{\textsc{#1}} \
      \Acr{css}. Next: \acr{css}. Full: \gls{css}.
20
21  \item Resetting all acronyms.\glsresetall{abbreviation}
22
23  \item Here are the acronyms again:
24
25  \item \Acr{html}, \acr{xml} and \acr{css}.
26
27  \item Next use: \Acr{html}, \acr{xml} and \acr{css}.
28
29  \item Full form: \Gls{html}, \gls{xml} and \gls{css}.
30
31  \item Provide your own link text: \glslink{[textbf]css}{style}
32
33 \end{itemize}
```

1922

E4 Glossary

This section shows examples of the use of `\gls{ }` commands in conjunction with the items that are in the `glossary.tex` and `notation.tex` files. Note that entries in `notation.tex` are prefixed with “`not:`” label (see List. E.4).

Please make sure that the entries in `notation.tex` are those that are referenced in the L^AT_EX document files used by this Thesis. Please comment out unused notations and be careful with the commas and brackets in `notation.tex`.

- 1929 • Matrices are usually denoted by a bold capital letter, such as \mathbf{A} . The matrix’s (i, j) th element is usually denoted a_{ij} . Matrix \mathbf{I} is the identity matrix.
- 1930 • A set, denoted as \mathcal{S} , is a collection of objects.
- 1931 • The universal set, denoted as \mathcal{U} , is the set of everything.
- 1932 • The empty set, denoted as \emptyset , contains no elements.
- 1933 • Functional Analysis is seen as the study of complete normed vector spaces, i.e., Banach spaces.
- 1934 • The cardinality of a set, denoted as $|\mathcal{S}|$, is the number of elements in the set.

1935 The verbatim L^AT_EX code for the part of Sec. E4 is in List. E.4.

Listing E.4: Sample L^AT_EX code for glossary and notations usage

```

1 \begin{itemize}
2
3   \item \Glspl{matrix} are usually denoted by a bold capital letter,
4       such as $\mathbf{A}$. The \gls{matrix}'s $(i,j)$th element is
5       usually denoted $a_{ij}$. \Gls{matrix} $\mathbf{I}$ is the
6       identity \gls{matrix}.
7
8   \item A set, denoted as \gls{not:set}, is a collection of objects.
9
10  \item The universal set, denoted as \gls{not:universalSet}, is the
11      set of everything.
12
13  \item The empty set, denoted as \gls{not:emptySet}, contains no
14      elements.
15
16  \item \Gls{Functional Analysis} is seen as the study of complete
17      normed vector spaces, i.e., Banach spaces.
18
19  \item The cardinality of a set, denoted as \gls{not:cardinality}, is
20      the number of elements in the set.
21
22 \end{itemize}

E6 Table

1944

This section shows an example of placing a table (a long one). Table E.1 are the triples.

TABLE E.1 FEASIBLE TRIPLES FOR HIGHLY VARIABLE GRID

Time (s)	Triple chosen	Other feasible triples
0	(1, 11, 13725)	(1, 12, 10980), (1, 13, 8235), (2, 2, 0), (3, 1, 0)
2745	(1, 12, 10980)	(1, 13, 8235), (2, 2, 0), (2, 3, 0), (3, 1, 0)
5490	(1, 12, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
8235	(1, 12, 16470)	(1, 13, 13725), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
10980	(1, 12, 16470)	(1, 13, 13725), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
13725	(1, 12, 16470)	(1, 13, 13725), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
16470	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
19215	(1, 12, 16470)	(1, 13, 13725), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
21960	(1, 12, 16470)	(1, 13, 13725), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
24705	(1, 12, 16470)	(1, 13, 13725), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
27450	(1, 12, 16470)	(1, 13, 13725), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
30195	(2, 2, 2745)	(2, 3, 0), (3, 1, 0)
32940	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
35685	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
38430	(1, 13, 10980)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
41175	(1, 12, 13725)	(1, 13, 10980), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
43920	(1, 13, 10980)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
46665	(2, 2, 2745)	(2, 3, 0), (3, 1, 0)
49410	(2, 2, 2745)	(2, 3, 0), (3, 1, 0)
52155	(1, 12, 16470)	(1, 13, 13725), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
54900	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
57645	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
60390	(1, 12, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
63135	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
65880	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
68625	(2, 2, 2745)	(2, 3, 0), (3, 1, 0)
71370	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
74115	(1, 12, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
76860	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
79605	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
82350	(1, 12, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
85095	(1, 12, 13725)	(1, 13, 10980), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
87840	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
90585	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
93330	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
96075	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
98820	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
101565	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
104310	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
107055	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
109800	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
112545	(1, 12, 16470)	(1, 13, 13725), (2, 2, 2745), (2, 3, 0), (3, 1, 0)
115290	(1, 13, 16470)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)
118035	(1, 13, 13725)	(2, 2, 2745), (2, 3, 0), (3, 1, 0)

E7 Algorithm or Pseudocode Listing

2058

Table E.2 shows an example pseudocode. Note that if the pseudocode exceeds one page, it can mean that its implementation is not modular. List. E.9 shows the corresponding L^AT_EX code.

2059

2060

TABLE E.2 CALCULATION OF $y = x^n$

Input(s):	
n	: n th power; $n \in \mathbb{Z}^+$
x	: base value; $x \in \mathbb{R}^+$
Output(s):	
y	: result; $y \in \mathbb{R}^+$

Require: $n \geq 0 \vee x \neq 0$

Ensure: $y = x^n$

```

1:  $y \Leftarrow 1$ 
2: if  $n < 0$  then
3:    $X \Leftarrow 1/x$ 
4:    $N \Leftarrow -n$ 
5: else
6:    $X \Leftarrow x$ 
7:    $N \Leftarrow n$ 
8: end if
9: while  $N \neq 0$  do
10:  if  $N$  is even then
11:     $X \Leftarrow X \times X$ 
12:     $N \Leftarrow N/2$ 
13:  else { $N$  is odd}
14:     $y \Leftarrow y \times X$ 
15:     $N \Leftarrow N - 1$ 
16:  end if
17: end while

```

E8 Program/Code Listing

2062

List. E.10 is a program listing of a C code for computing Fibonacci numbers by calling the actual code. Please see the `code` subdirectory.

Listing E.10: Computing Fibonacci numbers in C (`./code/fibo.c`)

```

1  /* fibo.c -- It prints out the first N Fibonacci
2   *          numbers.
3   */
4
5  #include <stdio.h>
6
7  int main(void) {
8      int n;           /* Number of fibonacci numbers we will print */
9      int i;           /* Index of fibonacci number to be printed next */
10     int current;    /* Value of the (i)th fibonacci number */
11     int next;        /* Value of the (i+1)th fibonacci number */
12     int twoaway;    /* Value of the (i+2)th fibonacci number */
13
14     printf("How many Fibonacci numbers do you want to compute? ");
15     scanf("%d", &n);
16     if (n<=0)
17         printf("The number should be positive.\n");
18     else {
19         printf("\n\n\tI\tFibonacci(I)\n\t=====\\n");
20         next = current = 1;
21         for (i=1; i<=n; i++) {
22             printf("\t%d\t%d\\n", i, current);
23             twoaway = current+next;
24             current = next;
25             next = twoaway;
26         }
27     }
28 }
29
30 /* The output from a run of this program was:
31
32 How many Fibonacci numbers do you want to compute? 9

```

2064

List. E.11 shows the corresponding L^AT_EX code.

Listing E.11: Sample L^AT_EX code for program listing

1 `List.~\ref{lst:fib_c}` is a program listing of a C code for computing Fibonacci numbers by calling the actual code. Please see the `\verb|code|` subdirectory.

2065 E9 Referencing

2066 Referencing chapters: This appendix is in Appendix E, which is about examples in using
 2067 various \LaTeX commands.

2068 Referencing sections: This section is Sec. E9, which shows how to refer to the locations
 2069 of various labels that have been placed in the \LaTeX files. List. E.12 shows the corresponding
 2070 \LaTeX code.

Listing E.12: Sample \LaTeX code for referencing sections

1 Referencing sections: This section is Sec.~\ref{sec:ref}, which shows
 how to refer to the locations of various labels that have been
 placed in the \LaTeX \ files. List.~\ref{lst:refsec} shows the
 corresponding \LaTeX \ code.

2104 E10 Citing

2105 Citing bibliography content is done using BibTeX. It requires the creation of a BibTeX
2106 file (.bib extension name), and then added in the argument of \bibliography{ } . For
2107 each .bib file, separate them by a comma in the argument of \bibliography{ } without
2108 the extension name. Building your BibTeX file (references.bib) can be done easily with a
2109 tool called JabRef (www.jabref.org).
2110

The following subsections are examples of citations.

2269 E11 Index

2270 For key words or topics that are expected (or the user would like) to appear in the Index, use
 2271 `index{key}` , where `key` is an example keyword to appear in the Index. For example,
 2272 Fredholm integral and Fourier operator of the following paragraph are in the Index.

2273 If we make a very large matrix with complex exponentials in the rows (i.e., cosine real
 2274 parts and sine imaginary parts), and increase the resolution without bound, we approach
 2275 the kernel of the Fredholm integral equation of the 2nd kind, namely the Fourier operator
 2276 that defines the continuous Fourier transform.

2277 List. E.15 is a program listing of the above-mentioned paragraph.

Listing E.15: Sample L^AT_EX code for Index usage

```
1 If we make a very large matrix with complex exponentials in the rows (i.  

   e., cosine real parts and sine imaginary parts), and increase the  

   resolution without bound, we approach the kernel of the \index{  

   Fredholm integral} Fredholm integral equation of the 2nd kind,  

   namely the \index{Fourier} Fourier operator that defines the  

   continuous Fourier transform.
```

2278

E12 Adding Relevant PDF Pages

2279

Examples of such PDF pages are Standards, Datasheets, Specification Sheets, Application Notes, etc. Selected PDF pages can be added (see List. E.16), but note that the options must be tweaked. See the manual of `pdfpages` for other options.

Listing E.16: Sample L^AT_EX code for including PDF pages

```
1 \includepdf[pages={8-10},%
2 offset=3.5mm -10mm,%
3 scale=0.73,%
4 frame,%
5 pagecommand={},]
6 {./reference/Xilinx2015-UltraScale-Architecture-Overview.pdf}
```

Notes:

1. Go to [Ordering Information](#) for package designation details.
2. All packages have 1.0mm ball pitch.
3. Packages with the same last letter and number sequence, e.g., A2104, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined. See the [UltraScale Architecture Product Selection Guide](#) for details on inter-family migration.

John Carlo Theo S. Dela Cruz received the B.Sc., M.Sc., and Ph.D. degrees in chemistry all from the Pamantasan ng Pilipinas, San Juan, Metro Manila, Philippines, in 2020, 2022 and 2025 respectively. He is currently taking up his B.Sc. Computer Engineering studies. He has developed several high-speed packet-switched network systems and node modules. His research interests include high-speed packet-switched networks, high speed radio interface design, discrete simulation and statistical models for packet switches.

Pierre Justine P. Parel received the B.Sc., M.Sc., and Ph.D. degrees in chemistry all from the Pamantasan ng Pilipinas, San Juan, Metro Manila, Philippines, in 2020, 2022 and 2025 respectively. He is currently taking up his B.Sc. Computer Engineering studies. He has developed several high-speed packet-switched network systems and node modules. His research interests include high-speed packet-switched networks, high speed radio interface design, discrete simulation and statistical models for packet switches.

Jiro Renzo D. Tabiolo received the B.Sc., M.Sc., and Ph.D. degrees in chemistry all from the Pamantasan ng Pilipinas, San Juan, Metro Manila, Philippines, in 2020, 2022 and 2025 respectively. He is currently taking up his B.Sc. Computer Engineering studies. He has developed several high-speed packet-switched network systems
